## FOREWORD

India has one of the largest child population in the world and children, therefore, are an important human resource. The state of our 380 million children has a profound influence on our future human resource. Our policies and programmes are shaped by our commitment to fulfil the needs of children. The profile of children in each state of our country would determine our regional priorities and initiatives from time to time.

Keeping in mind our meager resources at one end and our commitment to holistic development of children, we need to work out regional trends from micro-level data for need-based planning under the policy of decentralised planning and operationalisation of programmes for child development.

I am happy that NIPCCD has attempted to profile the situation of children of the country at district level to facilitate planning and intervention for optimal developmental inputs in areas identified for sectoral priorities under gender-specific intervention, nutrition, education and services for child labour under NLCs. The document would be of interest to all professionals and academicians, both in the Government and in the NGOs community who strive to improve the situation of children.

## PREFACE

Our commitment towards the Rights of the Child impels us to take stock of the situation of children in entirety, so as to identify the gaps, and recommit ourselves to strive harder to improve the plight of children. The shift from centralised planning to decentralised planning in development and tilt towards the micro-environment of children necessitates information at all India level.

Appreciating the need to make available, to policy planners, programme implementers and the members of the civil society working towards welfare and development of children, the basic district-level information on children, the Institute has brought out this publication at the instance of Ministry of Women and Child Development, Government of India.

The publication brings to fore the district-wise information on children through its 35 State/UT-wise chapters, covering the demographic profile of children, sex ratio of general population and children nutrition status, coverage and infrastructure for child education, manpower for education of children, coverage of child labour under National Child Labour Projects under various states of the country and incidence of crimes against children. The data has been obtained from State Directorates of Census Operations, Ministry of Labour, Department of Education and Food and Nutrition Board, and Ministry of Women and Child Development, Government of India.

Further computations on the district level data have been carried out to present district-wise percentages of child population, the Teacher - School ratio and the Student - Teacher ratio so as to facilitate development planning at the micro and macro levels.

It is believed that the analysis of district level data in each state would help identify priorities and broad strategic measures for policy planners, programme implementers and non-governmental agencies working for the development and wellbeing of children. The publication would also be of benefit to child development/human resource development specialists as also individual readers to undertake research in child development and related areas.

I am grateful to Dr. Adarsh Sharma, Former Director and Shri K.K. Singh, Former Additional Director of the Institute who provided valuable guidance and suggestions and Ms Tejinder Kaur - faculty member for the work she did in preparation of this publication.

(A.K.Gopal)  
Director

# Andhra Pradesh

## State Highlights – Census, 2001

- Growth rate of population in the state has declined for the first time from the maximum of 24.20 in 1981-91 to 13.86 in 1991-2001.
- Growth rate of population reported in Census, 2001 is the lowest since independence.
- Female literacy in Andhra Pradesh has gone up considerably from 32.72 in 1991 to 51.17 in 2001.
- Total literacy rate in the state has also gone up from 44.09 in 1991 to 61.11 in 2001.
- Sex ratio for the total population has improved for the total population but sex ratio for child population in the age group 0-6 years has declined from 975 in 1991 to 964 in 2001.

## *Highest and lowest population, percentage of growth, literacy and sex ratio among the districts of the state*

<i>Parameter</i>	<i>Highest</i>	<i>Lowest</i>
* Total Population	East Godavari: 4,872,622	Vizianagaram: 2,245,103
* Total rural population	East Godavari: 37,35,908	Rangreddi: 1,638,532
* Total urban population	Hyderabad: 36,86,460	Srikakulam:2,78,203
* Literacy rate	Hyderabad: 79.04	Mahbubnagar 45.53
* Sex ratio	Nizamabad: 1016	Rangareddi:941

## Child Population (0-6 years)

Nearly 12.8 percent of the total population comprises of children aged 0-6 years. In the districts Karimnagar, Srikakulam, Vizianagaram, Cuddapah and Anantapur the percent child population is closer to the state average of child population (Tables 1.1 & 1.2). Adilabad (14.5%), Medak (14.5%) and Kunool (14.8%) have much greater proportion of child population than the state average. It would be important to study the underlying factors due to which the percent child population in the districts of West Godavari, East Godavari, Hyderabad, Guntur and Nellore is far below the state average for child population. The reasons could vary from rate of infant mortality and under-five mortality to in-migration of adult labour force in cities like Hyderabad and out-migration of children from several other districts. The specific reasons for such variations need to be studied at the micro-level to design appropriate social interventions on improving child survival and curtail child abuse and trafficking.

## Sex Ratio

The most favourable sex ratio in the slum population is found in the districts of West Godavari (1028), Srikakulam (1024) and Vizianagaram (1023) as per Table 1.3. The least favourable sex ratio in the slum population has been reported in the districts of Nalgonda (926), Rangareddi (937) and Hyderabad (943). It would be interesting and useful to study the phenomenon of an

unusually high sex ratios of adult populations in Srikakulam and Vizianagaram and assess the reasons for its decline in the population age group of 0-6 years.

### **Sex Ratio in Child Population (0-6 years)**

Sex ratio of child population in the age group 0-6 years is not favourable for females in Nizamabad, Srikakulam, Vizianagaram and Karimnagar (Table 1.3). The lowest sex ratio was registered in Kurnool (944), followed by Hyderabad (950) and Cuddapah (952). The highest sex ratio was registered in Vizianagaram (981), followed by East Godavari (978) and Karimnagar (977).

### **Education**

Table 1.4 gives the absolute figures for the actual number of primary, middle, high and higher secondary schools in the state, beside the number of teachers available in each category of schools across the districts. The enrolment figures in each district show the functional aspect of elementary and high education. The analysis of infrastructure and manpower for education has been worked out in Table 1.5, based on the above figures to study the comparative teacher/ school ratios and student/ teacher ratios for each district. No other district is comparable with Hyderabad in respect of the teacher/ school ratio, which is an exception, being the state capital.

The districts Nizamabad, Adilabad, Rangareddy, Khammam, Visakhapatnam and Mehboob Nagar have less than 2 teachers per primary school and Srikakulam has the poorest Teacher/ School ratio of 1.0 percent only, the lowest in the state. The situation of educational manpower is again similar in case of Teacher/ School ratio for middle schools, which happens to be the lowest among the districts. At the High School and Higher Secondary School level, Visakhapatnam has the Teacher/ School ratio of 4.7 and need attention towards teaching manpower for High and Higher Secondary Schools in the districts.

The Student/ Teacher ratio is unreasonably high in primary schools of all districts of the state and can be directly correlated to low Teacher/ School ratio. The situation improves as one progresses to middle schools and high schools, as the teaching manpower increases and number of students going to high schools declines.

### **Coverage of Children under NCLPs**

In all 975 schools have been sanctioned for child labour of 22 districts in the state, of which 941 are functional (Table 1.6). While the coverage of children has to be improved in the districts Anantapur, Karimnagar, Medak, Nalgonda, Nellore, Nizamabad, Prakasam, Rangareddy and West Godavari, the data shows the need to open more schools for child labour of Hyderabad.

### **Crimes against Children**

Of the 43 incidents of murders, nearly 40 percent were reported in Anantapur district alone in the year 2002 (Table 1.7). There had been only one reported incident of infanticide in the state in Nalgonda district. Greater incidences of child rapes were reported in Hyderabad (20), Nalgonda (20), Anantapur (18), Karimnagar (14) and Medak (13) districts out of the 137 cases of rape reported among children. As many as 186 cases of kidnapping and abduction of children were reported in the state, and most of the incidents took place in Anantapur (43), Medak (10) and Nalgonda (10). However, no case of foeticide has been detected in Andhra Pradesh. Almost all

cases of abetment to suicide by children (11 out of 13) were from Anantpur. Stray cases of child marriage were found in Warangal, Anantapur, Hyderabad, Kurnool and Medak districts. Anantapur emerges as the district having maximum cases (90 out 333) of crimes against children, accounting for over 27 percent crimes against children in the state, followed by Nizamabad (39), Medak (34), Nalgonda (33), Karimnagar (29), West Godavari (29), Krishna (27) and Hyderabad (23). There is a visible need to study the underlying causes of very high incidence of crimes against children in the Anantapur district.

# Arunachal Pradesh

## State Highlights – Census, 2001

- 18.2 percent of the state's population is in the age group 0-6 years.
- The decadal growth rate for the state during 1991-2001 is 26.21 percent.
- The sex ratio of the state (901) is less than the national figure of 933.
- The literacy rate for the entire population of Arunachal Pradesh is 54.74 percent.

## *Highest and lowest population, percentage of growth, literacy rate, sex ratio and density among the districts of the state.*

<b>Parameter</b>	<b>Highest</b>	<b>Lowest</b>
* Total population	Lohit: 1,43,478	Twang: 34,705
* Percentage population growth (%)	Paapam pade: 67.21	East Kamang: 13.24
* Literacy rate	Paapam pade: 70.89	Twang: 41.14
* Sex ratio (females/ 1000 males)	Lower Sovensiri & East Kamang: 985	West Kamang: 749
* Density (persons/ sq.km)	Tirap: 42	Dibang valley: 4

## Child Population (0-6 years)

As evident from Table 2.1, the child population aged 0-6 years is the lowest in Upper Siyang (6223) and highest in Dibang Valley (27686). Children in the age group 0-6 years constitute 18.2 percent of the total population of the state. While Tawang (16.8%), West Kamang (16.3%) and West Siyang (16.7%) have child population in proportion lower than the state average, on the other hand the districts East Kamang (20.5%), Tirap (19.9%), Changlang (19.7%), Lohit (19.3%) and Upper Sovensiri (19.0%) have about one fifth of their population as children (Table 2.2). The reasons for such disparity need proper investigation to strategically plan for the state, about which not much is known on the socio-cultural front.

## Sex Ratio

The overall sex ratio for the state is 901, which is less than that for the country (Table 2.3). Sex ratio in 4 districts of Arunachal Pradesh is above the national average. The highest sex ratio of 985 has been returned by East Kamang and Lower Sovensiri districts. Except for West Siyang, the sex ratio has improved in other 12 districts of the state. In West Siyang, the sex ratio has fallen from 822 in 1991 to 749 in 2001 and needs to be investigated for the underlying causes.

## Nutrition

The average daily consumption of cereals, pulses, milk and its products, fats & oils and sugar in the 9 districts profiled by Food and Nutrition Board was below the respective recommended

allowances. The nutrient deficit was upto 18 percent for cereals, 27 percent for pulses, 78 percent for milk/ milk products, and as high as 84 percent for fats & oils and 89 percent for sugar. The low consumption of pulses was compensated with high consumption of flesh foods in all the districts (Table 2.4) and among children Table 2.5. Girls aged 1-3 years consumed more green leafy vegetables than boys and girls from 4-15 years ate more pulses than boys.

The protein energy adequacy status of children, adolescents and adults is shown in Table 2.6. About 18 percent of boys and 20 percent of girls, had protein energy adequacy (p+c+) and 22 percent of boys and 21 percent of girls had protein energy inadequacy (p-c-). Protein, by itself, was adequate among 77 percent of boys and 79 percent of girls. Calorie adequacy, on the other hand, did not improve further and was 18 and 20 percent among boys and girls, respectively. Twenty seven percent of boys and 37 percent of girls were found to have protein calorie (p+c+) adequacy while their inadequacy (p-c-) was observed among 13 percent of boys and 11 percent of girls. Eighty seven percent of boys and 89 percent of girls had protein adequacy while calorie adequacy was same as above i.e. 27 percent among boys and 37 percent among girls.

The average nutrient intake in the State according to age and sex is presented in Table 2.7. The average intake of all the nutrients except energy and fat was above the respective RDAs in the age group 1-3 years. In addition to energy and fats, iron and riboflavin intake was also below the RDAs in the age group 4-6 years. The average intake level among boys and girls was close to each other. The average intake of energy, fat, iron and riboflavin was less than their respective RDAs in this age group (7-12 years). The average intake of nutrients among girls, in the age group of 7-9 years was higher than that of boys while in the age group of 10-12 years, it was reverse. The average intake of energy, fat and iron was deficient among both boys and girls while riboflavin was deficient only among boys as compared to the RDAs in the age group of 13-15 years. However, in the age group 16-17 years, energy and iron intake was deficient among both boys and girls while vitamin A was deficient among girls and riboflavin among boys.

Such inadequate consumption as reported above has resulted in more than half the children in 9 districts being underweight (Table 2.8) and both stunting and wasting being common manifestation of chronic and continued malnutrition. These findings on malnutrition are again confirmed by Table 12 classifying children according to Gomez's classification on nutritional status (Table 2.9).

## **Education**

Greater attention has to be paid to the districts East Kamang, Kurung Kumay, Upper Subansiri, Dibang Valley and Changlang where on an average less than two teachers are available per primary school in order to recruit more primary teachers to provide elementary education to children in these districts. The student/ teacher ratio is undesirably high in the primary schools of all districts, again pointing towards an intense need to adequately man the primary schools with teaching staff. The student/ teacher ratio falls steeply at the middle school and High School level, not much due to improved availability of teachers but more due to sharp decline in the number of students who continue their education after primary school level, as evident from the joint study to Table 2.10 and 2.11. Thus, special attention has to be paid to improve enrolment of children in Middle and High Schools of the state to achieve universalization of school education in the state and build the human resource of the state.

## **Crimes against Children**

As evident from Table 2.12, Arunachal Pradesh can be called a crime free state for all practical purposes, as far as crimes against children are concerned. Only 6 cases of offences against children were reported in the whole state during 2002, including 3 kidnappings and abduction of children in Subansiri Lower, 2 child rapes in Changlang and 1 in Tirap.

# Assam

## State Highlights – Census, 2001

- Growth of population in the state during the post-independence period (1951-2001) is 231.78 percent against national growth rate of 184.42 during the period.
- Assam ranks 14<sup>th</sup> in size of population among states of India.
- Assam ranks 15<sup>th</sup> in density of population among the states of India.
- Assam ranks 18<sup>th</sup> in sex ratio among the states of India.
- Assam ranks 24<sup>th</sup> in literacy among the states of India.

## *Highest and lowest population, percentage of growth, literacy rate, sex ratio and density among the districts of the state*

<i>Parameter</i>	<i>Highest</i>	<i>Lowest</i>
* Total population	Kamrup: 2,515,030	North Cachar Hills:186,189
* Total rural population	Nagaon: 2,037,466	Nalbari: 128,110
* Total urban population	Kamrup: 900,518	Nalbari: 27,478
* Literacy rate	Jorhat: 77.91	Dhubri: 49.86
* Sex ratio	Goalpara: 955	North Cachar Hills:883

## Child Population (0-6 years)

Percentage of child population to total population of the district is highest in Dhubri (20.26) followed by Goalpara (18.95) and Morigaon (18.61) districts. The lowest percentage of child population to total population has been found in the district of Jorhat (12.32) followed by Kamrup (13.33), as evident from Tables 3.1 & 3.2.

A negative trend can be observed from the above table ranking the districts by child population and comparing figures for 1991 and 2001, in the case of 12 out of the 23 districts in the state. The negative variation is from -0.20 percent in Darrang to -14.54 in the districts of Nalbari. Apart from these two districts, the other districts showing negative trend in child population levels over the decade include Kamrup, Sonitpur, Cachar, Tinsukia, Dibrugarh, Bongaigaon, Lakhimpur, Sibsagar, Golaghat and Dhemaji. Well-designed investigative studies are required to be undertaken to find out the actual reason for a negative trend in growth of child population in half the districts in the state. The reasons could vary from insurgency related factors to malnutrition and health related mortality.

## Sex Ratio

Ranking of the districts according to the sex ratio in 1991 and 2001 shows that the highest sex ratio was recorded in Dhubri (986) followed by Sonitpur (984), Nagaon (982) and Bongaigaon

(981) and these districts have improved their ranking over the past decade (Table 3.3). During the last census in 1991, the highest sex ratio was recorded in N C Hills (995), which has fallen to 18<sup>th</sup> rank (out of 20) during census, 2001 due to the sex ratio declining to 942. The substantial decline in sex ratio in N C Hills needs to be studied. The lowest sex ratio was recorded in Jorhat (895). It is the only district in the state having a sex ratio of less than 900. The gender-related disparities prevailing in Jorhat district call for an assessment of social situation in the district as the district ranked 13<sup>th</sup> in the Census, 1991 and has further fallen to the last (20<sup>th</sup>) rank during census, 2001. A study of the factors leading to rise in sex ratio in Dhubri and Nagaon would also give us an insight into the improvement in the gender-construction and transitions in the society within the district and drawing lessons therefrom.

### **Sex Ratio of Child Population (0-6 years) in Urban Areas**

The data from urban areas collected during Census, 2001 shows that the highest sex ratio of child population is in Goalpara (1004) and the lowest is in Kamrup (888). The low sex ratio in urban areas of Kamrup district should be a cause of great concern as it is the only district with urban areas having sex ratio of child population below 900 and the sex ratio has steeply fallen from 947 to 888 in Census, 2001 as compared to Census, 1991. This could be due to misuse of modern technology of ultrasound sex-determination followed by female foeticide and needs to be urgently investigated. A similar inquest into the fall in sex ratio of child population in urban areas of Sibsagar (from 991 to 914) and Dibrugarh (from 963 to 916) is required.

### **Nutrition**

Data from the districts shows that the average consumption of cereals was above RDA in 8 districts, Marginally below RDA in 5 districts and quite below the recommended allowance in 9 districts. On an average, the intake of pulses and green leafy vegetables was by and large inadequate in most of the districts. The diet was observed to be inadequate in milk and milk products throughout the state. Upto the age of 12 years no gender difference had been reported in consumption of various food items (Table-3.4) but cereal intake in case of girls was reduced during adolescence. Such pattern of food consumption is responsible for the grossly inadequate energy intake in all the districts except Nalbari and North Cachar Hills (Table 3.5).

The average intake of nutrients in case of children in all age groups was inadequate across the districts of the state. Districts showing children with more than 1 % prevalence of nutrition deficiency signs as listed in Table 3.6. Table across the districts suffered from some degree of malnutrition in terms of Gomez classification (Table 3.7). Goalpara district had better nutritional status of children (63% normal children) which was in stark contrast to Dibrugarh (15% normal children) calling for a comparative study of the feeding patterns of children in the 2 districts, alongwith underlying factors.

### **Education**

On an average, there are 2-3 teachers in primary schools in each district of the state (Table 3.8). All the districts donot have pre-primary schools and some districts have as few as 1 (Lakhimpur), 2 (Cachor & Hallakaudi), 4 (Karimganj) or 5 (Bongaigaon & Tinsukia) pre-primary schools. The teacher/ school ratio for middle (6-8 teachers/ school) and high schools (10.6-20 teacher/ school) is better than that in primary schools, as observed from Table 3.9.

Due to these reasons, student/ teacher ratio in most districts is very high in case of primary schools but improves in several districts at the middle school level. The enrolment of students falls at high school level, which should be a cause for concern, and the resultant student/ teacher ratio also reflects the same in every district. We need to study the factors for drastic fall in enrolment at the high school level, across all the districts of Assam to devise appropriate policies and interventions. One possible factor could be the children in their adolescence, being drawn toward insurgency/ radical groups due to various reasons.

### **Crimes against Children**

By and large, it can be safely said that the state is free from crimes against children to a great extent (Table 3.10). However, the only apparent causes of concern are the activity of procuring minor girls from Karbi-anglong district (presumably for trafficking outside the state) and some instances of child rape reported in Nalbari district. In all 64 percent of the reported crimes against children comprise of procurement of minor girls and child rape, both of which are crimes against the girl child. Any awareness activity for intervention may be designed to discourage offences against the girl child and it may even be built into the general gender sensitisation camps and programmes.

# Bihar

## State Highlights – Census, 2001

- Growth rate of the population in the state has marginally declined from 30.34 percent in 1981-91 to 29.04 percent in 1991-2001.
- Sex ratio for the total population has improved from 907 in 1981-91 to 921 in 1991-2001.
- Female literacy in Bihar has improved by more than 11 percent during the decade 1991-2001 (from 21.99% to 33.57%).
- Total literacy rate in the state has gone up from 37.49 to 47.53 percent in 1991 and 2001, respectively.

## *Highest and lowest population percentage of growth, literacy and sex ratio among the districts of the state*

Parameter	Highest	Lowest
* Total Population	Patna: 4,709,851	Shivhar: 514,288
* Decadal growth	Shivhar: 36.16	Nalanda: 18.64
* Population density	Patna: 1,471	Kaimur: 382
* Literacy rate	Patna: 63.82	Kishanganj: 31.02
* Sex ratio	Siwan: 1,033	Patna: 873

## Child Population (0-6 years)

The average proportion of child population in the state is 19.6 percent, implying that children comprise nearly one fifth of the state population (Tables 4.1 & 4.2). Some districts like Arariya, Kishanganj, Poornia, Katihar, Madhepura and Khagdiya have child population above 21 percent and these should be the focus of campaigns for small family, child survival and development and reproductive and child health interventions. A lower proportion of children in Patna is probably due to migration of adults for labour to the state capital and the urban nature of the area.

## Sex Ratio

During the decade 1991-2001, there had been an improvement in sex ratio for the entire state (from 907 to 921) as observed from Table 4.3. In most districts, the sex ratio has improved during the decade, 1991-2001 but in Vaishali it has remained static at 921 and in Bhojpur it has declined by 4 points. It would be essential to identify the factors responsible for decline in sex ratio in Bhojpur and no improvement in sex ratio in Vaishali to correct the gender balance in these two districts.

## Nutrition

District-wise food consumption profile indicated that the average daily consumption of cereals, roots and tubers and other vegetables was adequate (Table 4.4). However, intake of cereals in 4 districts was slightly lower than the recommended level. On the other hand, the daily consumption of pulses, green leafy vegetables, milk and its products, fats and oils as well as sugar was highly inadequate in majority of the districts. The (Table 4.4) lists the districts where the intake of different food was inadequate.

District-wise disaggregated data revealed that average daily intake of iron, riboflavin and vitamin A in the diets was inadequate in almost all the districts (Table 4.5). Average energy intake was marginally below the recommended level in 28 districts followed by calcium in 18 districts, protein in 4 districts, vitamin C in 2 districts and thiamin and niacin in 1 district each. Table 4.5 lists the districts with inadequate intake of different nutrients. District-wise protein calorie adequacy status is presented in Table 4.6 and it can be seen that calorie-protein nutrition is far from adequate.

Table 4.7 shows the percentage prevalence of severe undernutrition among various districts of the state. The districts Araria, Deoghar, Dumka, Jamuahi, Kishanganj, Munger, Sahebganj and Samastipur have more than 40 percent cases of severe malnutrition, in terms of the Gomez classification of children. It has been reported in the "India Nutrition Profile" (Deptt. of WCD, 1998) that district-wise, the children with normal nutritional status varied from 3 percent to 20 percent barring a few districts, like Aurangabad (25%), Banka (63%), Bhagalpur (46%), Dhanbad (29%), Godda (44%), Katihar (59%), Madhepur (44%) Purnea (49%), Rohtas (34%) and Saharsa (47%), where the proportion of normal children was comparatively high. Generally, there were higher proportions of normal girl children as compared to boys in the districts, except in Arariya, Bhojpur, Deoghar, Hazaribagh, Khagaria, Kishanganj, Saran and Vaishali.

## Education

On an average there were at least 2 teachers in a primary school in the state, though the district-wise data was not available to identify districts which had one or no teacher in the school at primary level (Table 4.8). Even the absence of district-wise enrolment figures for students, the aggregate figures of enrolment at the 3 levels show that the fall in enrolment of children from primary to middle level is as steep as 75.5 percent, which further reduces at the High School level. The extremely high student teacher ratio of 96.5 at the primary level (Table 4.9) shows gross inadequacy of teaching manpower in proportion to the number of students enrolled. Thus, the focus in education of children in the state should be on increasing the manpower for teaching at the primary level and enhancing the enrolment of children at Middle and High School levels.

### Coverage of Children under NCLPs

The NCLPs are operational in 8 districts of the state. Education to child labour is imparted through 187 schools, catering to 11,213 children (Table 4.10). In Nalanda only 18 of the 25 schools that have been sanctioned are functional and therefore, only 1,752 out of the identified 2,500 child labourers can avail the educational and other services under NCLP. It would be desirable to make a concerted effort towards operationalising the 7 schools in Nalanda by removing impediments obstructing their being functional after having been sanctioned.

## **Crimes against Children**

The maximum proportion of crimes against children were reported from Khagaria (38.6%), followed by Lakhisarai and Nalanda (15.8% each) as evident from Table 4.11. Most cases of offences against children were of kidnapping and abduction (45.6%). Other major offences against children were those of child murders (17.5%) and procurement of minor girls (15.8%). Only 3 cases of child rape were reported from the state and those were from Khagaria district. The focus of interventions against crimes perpetrated on children should be on priority in the districts Khagaria, Nalanda and Lakhisarai and special campaigns should be designed for awareness generation against gender-based offences.

# Chhattisgarh

## State Highlights – Census, 2001

- The decadal growth has declined from 25.73% during 1981-91 to 18.06% during 1991-2001.
- The sex ratio has improved over the decade from 985 in 1991 to 990 in 2001.
- The proportion of child population in the age group 0-6 years is 16.68%.
- There has been a spectacular rise in the literacy rate over the decade from 42.91% in 1991 to 65.18% in 2001.

## *Highest and lowest population, percentage of growth, literacy rate, sex ratio and density among the districts of the state.*

Parameter	Highest	Lowest
* Total population	Raipur: 3,009,042	Kawardha: 5,84,667
* Percentage of population growth (%)	Sarguja: 24.58	Mahasamund: 8.72
* Literacy rate	Rajanandgaon: 77.58	Daantewaa: 30.01
* Sex ratio	Rajanandgaon: 1024	Koria: 947
* Density	Janjgir-Champa: 342	Daantewara: 41

## Child Population (0-6 years)

Nearly 16.68 percent of the population of the state comprises of children aged 0-6 years, as per Tables 5.1 & 5.2. It is significant to note that the percentage of population in the age group 0-6 years has declined from 19.34 percent in 1991 to 16.68 in 2001. Sarguja has the greatest proportion of children aged 0-6 years (18.77%) in its population and Durg has the lowest proportion of children under 7 years (15.27%). However, the proportion of children in the state, across the districts is high and requires control through effective implementation of ICDS and RCH Programmes in close coordination.

## Sex Ratio

The sex ratio for the entire state is 990. It can be seen from Table 5.3, the ratio is above 900 in all the districts and in 7 out of 16 districts, it is more than 1000 implying a more favourable sex ratio for females. The highest ratio has been reported in Rajanandgaon (1024), followed by Mahasamund (1019), Daantewara (1017), Baster (1009), Kaanker (1006) and Dhamtari (1005)

and Kawardha (1002). The district Korba has the lowest sex ratio of 947, which is above the national average of 933.

## **Education**

There were less than 2 teachers, on an average, in the Primary Schools of Korba, Bemetra, Bastar and Dantewada districts (Table 5.4). Therefore, one of the focal points should be to step up recruitment of teachers in Pre-primary and Primary Schools of tribal pockets within the state. Except for Jaspur district, all other districts in the state had high Student/ Teacher ratio at the Primary School level due to lack of adequate number of teachers in position to teach the enrolled students in the Primary Schools (Table 5.5). Similarly, only the Student/ Teacher ratio for Middle Schools of Dantewada was optimal and all the other districts did not have adequate staff strength to teach Middle School students. The Student/ Teacher ratio improved at the High School level in most districts, with the exception of Bemetra, Kawardha and Bastar. Such trends of inadequacy of teachers at the Primary and Middle School level is visible in the averages of ratios for the state.

The fall in enrolment level at the Middle and High School level can be seen in all the districts of the state (Table 5.4) and on an average, there is a decline of 64.3 and 80.8 percent at the Middle and High School levels, respectively when compared with enrolment at Primary School level.

## **Crime against Women**

As revealed from Table 5.6, nearly one third of the crimes, against children were committed in Durg (28.3%). Other districts which accounted for most cases of offences against children were Bilaspur (16.7%), Jagdalpur (14.0%), Sarguja (13.0%) and Raipur (11.5%). Five cases of infanticide were reported from Raipur and 26 cases of child marriage were detected in Bilaspur. The most common crime against children was child rape, accounting for nearly 25 percent of the offences against children. Most cases of child rape were reported from Sarguja (26.9%), Raipur (19.2%), Koriya (18.7%) and Bilaspur (15.4%). Thus, the above districts are a priority for any gender based intervention. Around 35.6 percent cases of kidnapping were from Sarguja alone and half the proportion of such cases were reported from Janjgir. About one third of the case of child murder were from Raipur.

# Delhi

## State Highlights – Census, 2001

- Population grown by 46.31 percent
- Decline in decadal growth rate by 5.14 percent
- 6 percent decline in sex ratio
- Rise in literacy rate by 6.53 percent
- Female literacy increased by 8.01 percent

## *Highest and lowest population, percentage of growth, literacy and sex ratio among the districts of the state*

Parameter	Highest	Lowest
* Total Population	North West: 2,860,869	New Delhi: 179,112
* Total rural population	North West: 2,63,487	East: 18,123
* Total urban population	North West: 25,83,908	New Delhi:1,71,806
* Literacy rate	North West: 80.79	North East:77.85
* Sex ratio	Central: 843	South West:783

## Child Population (0-6 years)

Child population in Delhi comprises about 13.9 percent of the entire population (Tables 6.1 & 6.2). Both New Delhi (11.1%) and Central (11.8%) district have lesser proportion of children as compared to the state average on account of the family composition and profile of the areas. On the other hand North-East district, which has the lowest literacy level, among the 9 districts has the maximum proportion of children (16.1%). Thus, the North-East district require a proper campaign on promotion of small family norm.

## Sex Ratio

Sex ratio of total urban population in Delhi is 822, which is one point above the sex ratio for the entire NCT of Delhi (Table 6.3). A cause of concern is the fact that the sex ratio for the rural population of Delhi is considerably low (806). The highest sex ratio in urban areas is reported in North-East district (851) and the lowest is in South-West district (778). Among the rural areas, North-East district (850) again has the highest sex ratio, while rural areas of West Delhi have the lowest sex ratio of 763. The sex ratio of the total population in NCT of Delhi has to be carefully

analysed in reference to the type and extent of migration from other states as a predominant factor and mortality and birth related factors come into play thereafter. The sex ratio of all the districts of Delhi remaining within 900 can be explained properly only by such investigation of the population dynamics.

### **Sex Ratio of Child Population (0-6 years)**

As can be seen from Table 6.3, the highest sex ratio of children upto 6 years of age, is of rural East district (933), closely followed by the North-east district (895). The lowest sex ratio among rural children aged 6 years and below has been registered in West District (798). The sex ratio among urban child population was observed to be highest in Central District (902). However, in most districts of Delhi including urban and rural pockets, the sex ratio of was under the figure of 900 for the child population as well which should be a genuine cause of concern, in view of misuse of sex determination techniques coupled with selective abortion facilities available.

### **Nutrition**

Table 6.4 presents the food consumption profile by age and sex. The average consumption of foodstuffs by boys and girls had marginal differences in this age group. No marked differences were observed in consumption of foodstuffs between boys and girls in this age group. Generally, all foodstuffs had higher consumption among adolescent boys except for flesh foods.

The average nutrient intake by age and sex in Table 6.5 shows that the average nutrients intake was grossly inadequate being below the RDA in the age group 1-3 years for all the nutrients except for protein and calcium. Average fat and thiamin intake exceeded the RDA levels in addition to protein and calcium in the age group of 4-6 years. Intake of other nutrients remained below the RDAs. The average protein, fat, calcium and thiamin intake was above the respective RDAs in the age group 7-9 of years. While the average fat, thiamin and vitamin C intake exceeded the level of RDA. Intake of all the other nutrients was below the RDA in the age group of 10-12 years. The average intake of fat, thiamin and vitamin C was above the respective RDAs among the adolescents. Energy, protein, iron, riboflavin and vitamin A intake was much below the RDAs, in this age group.

The energy and protein adequacy is observed to be adequate in less than half the children and nearly one fourth of children did not have sufficiency of either energy or proteins in their diets (Table 6.6). The adequacy of proteins and energy was slightly better in case of adolescents but more than one third of adolescents has inadequacy of these nutrients in their diets.

Table 6.7 shows that in the age group 1-5 years a greater proportion of girls (26%) had normal nutritional status as compared to boys (17%) in the same age group. Mild and moderate malnutrition was observed in 44 and 27 percent children, respectively. Lesser percentage (7%) of girls suffered from severe malnutrition as compared to boys (10%) as per Gomez classification. Almost 45 percent boys and 39 percent girls were underweight and about 14 percent of children were severely underweight.

### **Education**

The state has a relatively lesser number of Middle Schools as compared to Pre-primary, Primary and High Schools (Table 6.8). Table 6.9 indicates that the low Student/ Teacher ratio at High School level is essentially due to a lesser number of student's enrolling at that level.

## **Crimes against Children**

As can be seen from Table 6.10, the most frequently reported crime against children is kidnapping and abduction of children (61.1%), followed by child rape (19.8%), child murder (4.2%) and exposure and abandonment of children (4.2%). Foeticide comprises nearly 3 percent of crimes against children and 90 percent of such cases have been reported from South West Delhi. Therefore, all efforts to prevent female foeticide should be focussed on this district.

More than one third of the offences against children (37.7%) are committed in North West Delhi. This particular district accounts for 44.6 percent kidnappings and abductions of children and 43.5 percent of child rapes occurring in the state. Thus, special programmes have to be organised for the parents to ensure better child security and the law and order machinery has to be sensitised towards security needs of children.

# Goa

## State Highlights – Census, 2001

- The percent decadal population growth is 14.89 percent for the state.
- Sex ratio for Goa has been reported as 960.
- The literacy rate for Goa (82.32%) is higher than the national average (65.38%).
- Female literacy in Goa (75.51%) is much greater than the female literacy reported for the whole country (54.16%).

## *Highest and lowest population, percentage of growth, literacy rate, sex ratio and density among the districts of the state.*

Parameter	Highest	Lowest
* Total population	North Goa: 7,57,407	South Goa: 5,86,591
* Total rural population	North Goa: 4,17,174	South Goa: 2,57,955
* Total urban population	North Goa: 3,40,233	South Goa: 3,28,636
* Percentage of population growth	South Goa: 16.6	North Goa: 13.93
* Literacy rate	North Goa: 84.12	South Goa: 79.98
* Sex ratio	South Goa: 972	North Goa: 951
* Density	North Goa: 363	South Goa: 298

## Child Population (0-6 years)

About 10.58 percent of the total population comprise of children in the age group 0-6 years, as per Census, 2001 (Tables 7.1 & 7.2). There has been a decline of 1.16 percent points in the population in the age group 0-6 years. The percentage of male and female population aged 6 years or below works out to 10.73 and 10.42 percent, respectively. When compared with corresponding figures of Census, 1991, it is observed that there has been a decline of 1.02 percent among boy children and 1.30 percent among girl children in the age group 0-6 years. The percentage of the population in the age group 0-6 years has decreased by 1.20 percent in South Goa district and by 1.14 percent points in North Goa district. The extent of decrease is slightly higher among the females as compared to males of the age group 0-6 years in the state as well as the districts.

## Sex Ratio

The trend in sex ratio has been quite different in Goa than in the whole country. From 1900 to 1960, the sex ratio in the state favoured females but thereafter had turned in favour of males and

the later trend continued even upto Census, 2001. Despite the in-migration of male population into Goa, leading to fall in sex ratio in the later decades, the sex ratio for the state still continues to be above the National average (Table 7.3). Goa is the third state after Kerala and Union territory of Pondicherry to report sex ratio (960) above the country's sex ratio (933). Sex ratio of urban Goa (933) is more adverse to females as compared to that of rural Goa (988).

### **Sex Ratio of Child Population (0-6 years)**

As compared to the sex ratio for the entire population of the state (960), the sex ratio of 933 for child population in the age group 0-6 years is considerably lower (Table 7.4). Rural and urban sex ratio for children upto 6 years of age works out to 948 and 919, respectively, as compared to 988 and 933 for the total rural and total urban population of the state. Thus, rural sex ratio of child population in the age group 0-6 years is much adverse for the girl children in the rural population of the state and needs to be studied with the help of a scientifically designed research protocol to assess the ground situation. The sex ratio of child population has come down from 964 in 1991 to 933 in 2001, registering a decrease of 31 points. The decrease in urban sex ratio is very sharp being 34 points as compared to 24 points in rural sex ratio.

### **Education**

There is a steep fall in the enrolment figures after elementary/ primary school level and results in nearly 40 percent fall in enrolment of children at the middle school level (Table 7.5). To make things worse, the number of middle schools is as low as 84 which is unreasonably low, considering 1033 primary schools and 442 high schools. The comparative Student/ Teacher ratio at the 3 level, as per Table 7.6, again shows few teachers being recruited for middle schools, leading to an adverse ratio of 118.9, which is far from desirable.

### **Crimes against Children**

Child rape (22.6%) was the most common crime against children in the state and most cases (6 out of 7) were reported from North Goa (Table 7.7). More than 16 percent of offences against children comprised of exposure and abandonment and nearly 13 percent cases related to kidnapping and child abduction, with both districts contributing equally to these crimes against children.

# Gujarat

## State Highlights – Census, 2001

- Growth of population after independence is more than 3 times.
- The state ranks 10<sup>th</sup> in population size and 21<sup>st</sup> in population density among the states in the country.
- Gujarat ranks 15<sup>th</sup> in literacy among the Indian States.
- The State ranks 22<sup>nd</sup> in sex ratio in state-wise ranking of the states in the country.

## *Highest and lowest population, percentage of growth, literacy and sex ratio among the districts of the state*

Parameter	Highest	Lowest
* Population	Ahmedabad: 5,808,378	The Dangs: 1,86,712
* Percent population growth	Surat: 47.04	Amreli: 6.45
* Literacy	Ahmedabad: 79.89	Dohad: 45.65
* Sex ratio	Amreli The Dangs: 986	Surat: 835

## Child Population (0-6 years)

As evident from Table 8.1, Ahmedabad district has the highest number of children and the Dangs district has the lowest number of children. Table 8.2 reveals that 13.6 percent of the population of the state comprise of children. The child population in some backward/ tribal districts like Dohad (19.6%), Banas Kantha (18.2%) and The Dangs (18.8%), is far above the state average (13.6%). Thus, there is a strong need to work out a systematic Plan-of-Action to bring down the proportion of children and to provide adequate child care services in these districts. An Appraisal Study could be planned to identify the reasons for greater proportion of children in these districts despite the existing schemes and programmes.

## Sex Ratio

The sex ratio of Gujarat has gone down by 15 females per thousand males during the decade 1991-2001, as revealed from the comparison of the Census data for the years 1991 and 2001 (Table 8.3). As per Census, 2001, the sex ratio for the state is 919 and on inclusion of earthquake affected areas it comes to 921.

Among the districts of Gujarat, the Dangs (a tribal district) and Amreli have the highest sex ratio of 986, closely followed by Dohad, having a sex ratio of 985. The lowest sex ratio has been reported in Surat (835). In both the consecutive Censuses of 1991 and 2001, the districts of Ahmedabad, Anand and Surat have recorded sex ratio lower than the state average. The most disturbing observation has been the drastic fall of the sex ratio of Surat from 901 to 835 during the decade 1991-2001. There is an urgent need to look into the cause(s) of such a negatively skewed trend of sex ratio in Surat during the last decade, which if left unattended, may lead to worsening of the situation. Research studies are required to investigate the phenomena of static sex ratio in Amreli and Narmada and falling sex ratio in Ahmedabad, Gandhinagar, Valsad, Mahesana, Rajkot, Patan, Bhavnagar, Porbandar and Sabarkantha districts. The selective elimination of female children through sex-selective techniques (female foeticide using ultrasound followed by abortion) and female infanticide could have been a significant factor in reported decline in the sex ratio. The extent of influence of migration on sex ratio also needs to be determined, besides gender related factors affecting sex ratio of each of the above discussed districts.

### **Sex Ratio in Child Population (0-6 years)**

The percentage of 0-6 years children to the overall population can be seen as a crude indicator of fertility (though errors may creep in due to phenomenon of migration). Its limitations notwithstanding, if it taken as an indicator of fertility, the percentage of children 0-6 years to the total population is only 14.19 percent in 2001 as compared to 16.53 percent in 1991. Thus, it could be concluded that there has been a fall in overall fertility of Gujarat. In the same manner, if we assess the district level data of Census 2001, Dohad is showing the highest fertility with children in the age group of 0-6 years comprising 19.57 percent of total population. By the same standard, Navsari district has the lowest fertility in Gujarat, as only 11.5 percent of the population is in the age group 0-6 years.

The sex ratio of children aged 0-6 years is a relatively secular indicator, that is immune to errors/bias in drawing conclusions related to sex ratio, as unlike sex ratio for the entire population, it is not affected by migration for various reasons, within and outside the state.

An adverse sex ratio for child population of Gujarat in the age group 0-6 years reported during Census 2001, is a cause of grave concern. It has declined from 928 in 1991 to barely 878 in 2001. Further, the ratio is observed to be poorer in urban (825) areas than in rural (905) areas of the state. The district of Mahesana fared worst with 798 girl children against 1000 boy children in the age group, while The Dangs reported the best sex ratio of 974 for child population aged 0-6 years.

### **Education**

Though the district-wise breakup of the number of pre-primary and primary schools and the number of children in these schools was not available but the overall aggregates in Table 8.4 show that the primary schools have less than 2 teachers per school on an average. The aggregate figures also show that Student/ Teacher ratio was very high due to lack of adequate number of students at the primary school level. The number of students enrolled at middle school level fell drastically and the number of teachers recruited at the middle school level was the highest among the 3 levels, leading to a very low Student/ Teacher ratio (Table 8.5). There is a relative decline in the number of students enrolled at the High School level, as compared to the Middle School level due

to various economic and social reasons. The emphasis should be on Counselling families to enable and allow their children to complete schooling for better employment prospects and open more High Schools to overcome transportation problems and improve access of children to High Schools.

### **Crimes against Children**

Kidnapping and abduction comprised 38.5 percent offences against children as per Table 8.6. A little more than 10 percent offences related to exposure and abandonment of children, followed by child murders (9.6%) and child rapes (9.4%). The 4 cases of infanticide in Gujarat were from Rajkot. Half the cases of foeticide in the state were from Palampur. As many as 76.3 cases of child marriage were registered in Bhavnagar, pointing toward serious requirement of a systematic and organized campaign against child marriage. More than 60 percent of the offences against children that take place in Kutch (67.7%), Amreli (63.2%), Ahmedabad (60.5%) and Rajkot (60.0%) constituted kidnappings and abductions of children, calling for greater attention in these districts towards safety of children and raising awareness against the offence and its prevention.

# Haryana

## State Highlights – Census, 2001

- Urban population of the state has increased from 24.63 percent in 1991 to 29.00 percent in 2001.
- Sex ratio of Haryana has marginally declined to 861 in 2001, as compared to 865 in 1991.
- Child sex ratio of Haryana at 820 is second lowest in India, after Punjab at 793.
- Urban child sex ratio of Shahbad town is barely 718 despite having second highest sex ratio of literates in Haryana at 796.
- The absolute decadal growth in Haryana during 1991-2001 of rural population in 0-6 years age group was +1051, implying percent growth of 0.04%.
- Literacy rate has increased in the state from 55.85% in 1991 to 68.59% in 2001.
- Female literacy in the state has increased from 40.47% in 1991 to 56.31% in 2001.

## *Highest and lowest population, percentage of growth, literacy rate, sex ratio and density among the districts of the state*

Parameter	Highest	Lowest
* Total population	Faridabad: 2,193,276	Panchkula: 469,210
* Total rural population	Gurgaon: 1,288,365	Panchkula: 260,538
* Total urban population	Faridabad: 1,220,194	Mahendragarh: 109,303
* Percentage of population growth	Panchkula: 87.55	Rohtak: 36.30
* Literacy rate	Ambala: 76.20	Fatehabad: 58.17
* Sex ratio	Gurgaon: 863	Kurukshetra: 770

## Child Population (0-6 years)

The proportion of child population in the total population has declined steadily from 22.75 percent in 1971 to 19.48 percent in 1981 and further from 18.98% in 1991 to as low as 15.46% in 2001. Table 9.1 gives the figures for child population, enumerated in Census, 2001. This decline has been observed in the proportion of children aged 6 years and below in both the rural and urban areas. It is to be assessed through well-designed controlled studies, if the decline is due to successful implementation of family welfare programme or any other cause.

On an average around 15.5 percent of population comprises of children (Table 9.2). The two districts of Gurgaon (19.8%) and Faridabad (17.1%) have much higher proportion of child

population. Thus, block-level efforts are required to bring down the proportion of children in these 2 districts under the district-level plans with a gender component and child survival inputs.

## **Sex Ratio**

As can be seen from Table 9.3, in rural areas of Haryana, sex ratio is 867, which is comparatively higher than the sex ratio of 847 in urban areas of the state. Sex ratio in the state has been declining continuously since 1981 and is reported to be 861 during Census, 2001. Both migration to urban areas and misuse of sex selective technology has resulted in constant fall in sex ratio in the state. Lower social status of women and girl children, leading to higher incidence of female mortality, female foeticide and under five mortality among girl children has assumed dangerous proportions, as reflected in the sex ratio of most of the districts and their rural and urban areas. None of the urban areas of any of the districts has a sex ratio of 900 and above. Only the rural areas of Mahendragarh (925) and Rewari (912) have sex ratio above the 900 mark and rural Panchkula has sex ratio of only 797, followed by rural Sonipat (837).

### **Sex Ratio of Child Population (0-6 years)**

The abysmally low sex ratio in the age group 0-6 years (Table 9.3) shows that the preference for sons and availability of easy access to sex selective technology has led to enhanced elimination of the female child at various stages from fetal life to the infant and under 6 years of childhood. The district-wise baseline study on factors leading to adverse sex ratio followed by appropriately designed campaigns, geared towards the specific requirements of rural and urban areas against sex selective practices would reduce crimes against women, cross cultural migration of women and subsequent racial tensions. Districts having higher sex ratio in the state have been observed to be less prone to crimes against women. The lowest sex ratio in the child population aged 0-6 years was observed in rural areas of Ambala (772) and Kurukshetra (772) and the highest sex ratio was observed in rural areas of Panchkula. The highest sex ratio among urban population of children under 7 years was observed in Faridabad district, whereas urban areas of Kaithal had the lowest sex ratio of 756.

## **Nutrition**

District-wise consumption data shows that cereals consumption was comparable to the RDA in Ambala, Faridabad, Jind, Kaithal, Karnal and Sonipat districts and substantially above the recommended allowance in Kurukshetra, Panipat, Rewari and Sirsa Districts (Table 9.4). In the remaining six districts cereals intake was markedly below the RDA. Pulses consumption was much below consumption also. On an average, consumption of green leafy vegetables were negligible ranging from 0 to 13 gram per consumption unit in Bhiwani, Faridabad, Gurgaon, Hisar, Jind, Karnal, Mahendragarh, Panipat, Rohtak and Yamunanagar, as per survey by the Food and Nutrition Board (Deptt. of WCD, 1998). Its consumption in other districts was above the RDA except in Rewari district (31 g/cu/day). Average, roots and tubers consumption was comparable with its RDAs in the districts. Average consumption of other vegetables was below the RDA in most of the districts except in Faridabad, Mahendragarh and Rewari. Milk and its products and sugar intake was comparable with the respective RDAs. However, fats and oils intake varied from district to district ranging from 8 g/cu/day in Faridabad district to 52 g/cu/day in Ambala districts.

The average intake of protein, calcium and thiamin was comparable to or above the RDA while energy, fat, iron, riboflavin, niacin, vitamin C and vitamin A intake was deficient in comparison with RDA in the age group 1-3 years (Table 9.5). Average fat intake improved and was in excess of RDA in the age group 4-6 years; intake of other nutrients being similar as in the age group 1-3 years. The average intake of protein, fat, calcium, thiamin and niacin was adequate, being above the RDA and intake of energy, iron, riboflavin, vitamin C and vitamin A was below the RDA in the age group of 7-9 years. The average intake of nutrients in the age group of 10-12 years was similar as that of 7-9 years except that iron intake among girls was higher and was above the RDA in this age group. The average intake of protein, fat, calcium, thiamin and niacin was comparable to RDA or in excess of RDA and intake of energy, iron, riboflavin, vitamin C and vitamin A was deficient in the age group of 13-15 years among both boys and girls. The average energy intake among girls was higher and vitamin C intake comparable to RDA in the age group of 16-17 years; intake of other nutrients being similar as in the age group of 13-15 years.

Table 9.6 presents categorisation of districts according to severe undernutrition at district level. Prevalence of severe undernutrition in the State was as low as 4 percent and in the districts it was highest in Karnal district (13 %) followed by Faridabad (8%), Bhiwani (6%) and Panipat (6%) districts. It was below 5 percent in all the other districts. The severe undernutrition was as low as 2 percent in Kurukshetra district, though half of the surveyed children suffered from moderate undernutrition in Kurukshetra district, being highest among all the districts. Gurgaon district had the lowest prevalence of severe (1%) as well as moderate undernutrition (4%). Table 9.7 shows the percentage of distribution of school age children and adolescents by age and sex using Gomez classification of weight for age. The percent prevalence of severe undernutrition in the age group of 6-9 years of school age children was markedly different than those of 10-13 years. Prevalence of severe undernutrition was 7 percent in the age group 6-9 years while the corresponding prevalence was 17 percent in the age group of 10-13 years. In contrast, moderate undernutrition was almost same in both the age groups, prevalence of mild undernutrition and normal children were higher in the age group of 6-9 years as compared to the 10-13 of years, indicating improved nutritional status of children in the age group of 6-9 years. Sex differences in the various grades of undernutrition were not marked. The prevalence of severe and moderate undernutrition in the age group of 14-17 years were 12 and 41 percent respectively. Percentage of normal was about 7 and mild 41 in the total children. Girls in the age group of 14-17 years had improved nutritional status because of their lower prevalence of severe (10%) and moderate (37%) undernutrition and higher percentage of normal (9%) children as compared to boys (severe 14%, moderate 44% and normal 4 %) in this age group. Table 9(b) indicates that children in most districts are underweight and in several cases more than half the child population is underweight. Except for Gurgaon (15.5%), the other districts have a serious problem of stunting, indicating chronic malnutrition. The districts Bhiwani, Faridabad, Kaithal, Karnal, Kurukshetra, Sonapat and Yamunanagar have 68 to 95 percent stunted child populations. Rohtak has nearly half its child population stunted and one-third wasted. Other districts have 10-20 percent child population showing signs of wasting.

Table 9.8 presents the prevalence of underweight, stunting and wasting across the district child populations. Stunting is a very serious problem among the children of Haryana, implying chronic

undernutrition. The problem of underweight children is of great concern in more than 60 percent districts of the State. Even though food production and availability is not a serious problem in the State but the problem relates more to the purchasing power, food habits and knowledge of the people.

## **Education**

Data from Middle and High Schools (Tables 9.9 & 9.10) shows that in Middle Schools Student/Teacher ratio is too high owing to recruitment of inadequate number of teachers in comparison to the number of students enrolled, whereas the ratio improves at High School level due to approximately 10 times the number of teachers being available at High School as compared to Middle School level.

## **Crimes against Children**

Faridabad district accounts for one fourth of the offences against children in the state, closely followed by Panipat (24.3%) and Karnal (21.7%) and these three districts jointly account for 71 percent of the crimes against children in the state (Table 9.11). More than one third of the offences against children comprise of child rapes (35.7%) and kidnapping and abduction is the next most common offence (23.0%). Most child rapes occur in Karnal (38.1%), Panipat (27.4%) and Faridabad (13.1%). Kidnappings and abductions of children are common in Panipat (37%), Faridabad (25.9%), Jind (11.1%) and Karnal (9.3%). Infanticides account for 27.3 percent of the case of child murder. Two third of the cases of infanticide are from Faridabad and one third from Panipat. Stray cases of foeticide have been reported from Gurgaon (3), Sirsa (2) and Faridabad (1).

# Himachal Pradesh

## State Highlights-Census, 2001

- Population of the state increased more than two times after independence.
- Population of the state constitutes 0.59 percent of the country's population and ranks at 21<sup>st</sup> position.
- The state ranks 11<sup>th</sup> in literacy among the states of India.
- In sex ratio, the state ranks at 9<sup>th</sup> position among the Indian states.
- The state has the lowest proportion of urban population (9.79%) among the various states/ UTs in the country.

Shimla is the only urban agglomeration with one lakh and above population in Himachal Pradesh

## *Highest and lowest population, percentage of growth, literacy rate and sex ratio among the districts of the state.*

Parameter	Highest	Lowest
*Population	Kangra: 1,338,536	Lahul & Spiti: 33,224
* Percent population growth	Solan: +30.64	Lahul & Spiti: +6.17
* Literacy	Hamirpur: 83.16	Chamba: 63.73
* Sex ratio	Hamirpur: 1102	Lahul & Spiti: 804

## Child Population (0-6 years)

Table 10.1 gives the absolute figures for the total population and the child population, as per Census, 2001. The proportion of child population in the age group (0-6) years, is 12.8 percent of total population in the state. Child population in rural and urban areas of the state is 13.1 and 10.2 percent, respectively. The highest percentage of child population has been recorded in Chamba (14.93%) followed by Sirmaur (14.64%). The tribal district of Lahul & Spiti has the lowest proportion of child population (10.90%) in the state, pointing towards special needs of the children below 6 years in the cold and hostile climate of this tribal district to improve child survival.

Even though Shimla is the most populated urban agglomeration and Solan is the district showing highest percentage of population growth due to addition of new town and setting up of industries in the district, the highest percentage (12.38) of urban child population has been reported in Una during Census, 2001. It is followed by urban areas of Sirmaur (12.01), Bilaspur (11.08), Solan (10.69), Chamba (10.44), Hamirpur (10.31), Kangra (9.97), Kullu (9.88), Mandi (9.77) and Shimla (9.36). Among the rural areas, Chamba has the highest proportion (15.29%) of child population upto 6 years of age and Lahul & Spiti has the lowest ranking with 10.90% rural child population in the age group 0-6 years.

The phenomenon of in-migration and out-migration of mobile labour population at district level is an important factor in determination of child population structure of districts in addition to the childbirth and mortality related factors.

### **Sex Ratio**

The sex ratio in the state had slightly declined during the decade in the state (from 976 in 1991 to 970 in 2001) and remains above the national average for sex ratio during Census, 2001. Sex ratio in districts like Hamirpur (1102), Kangra (1027), Mandi (1014) reflect a positive reflection of gender construct of the society that needs to be studied in detail. The data related to sex ratio in Kinnaur was not available upto the time of release of Provisional Population Totals for the state related to Census, 2001.

The sex ratio in the urban population of the state comes only 797 females per 1000 males as per provisional figures of Census, 2001 (Table 10.2). The highest sex ratio of 1007 females per 1000 males is found in urban areas of Seoni sub-division of Shimla, closely followed by Kangra sub-division (986), as revealed from the data of Census, 2001 for Himachal Pradesh. The lowest sex ratio was reported from urban areas of Nalagarh sub-division (455), followed by urban area in Manali (567).

### **Sex Ratio of Child Population (0-6 years)**

Sex ratio of child population in the age group 0-6 years has been reported in Census, 2001 to be 897 (Table 10.2). The highest sex ratio of 1032 females per 1000 males in the child population aged upto 6 years has been recorded in Pangi sub-division (Chamba district) and Junga sub-division (Shimla district). The lowest sex ratio (738) has been reported in the Thural sub-division of Kangra district.

While sex ratio is as high as 1027 for the entire population of the Kangra district, it is as low as 836 for the child population in the age group 0-6 years. Similarly, the sex ratio for the total population of Hamirpur is 1102 but sex ratio for its child population upto 6 years is barely 864. Such vast difference in sex ratio of total population and child population in the age group in these two districts requires detailed investigation of the underlying factors.

### **Nutrition**

On an average, cereals, pulses, roots and tubers were consumed in higher quantity by girls than boys in the age group of 1-3 years (Table 10.3). The differences in consumption of various foodstuff by boys and girls in the age group of 4-6 years were not marked. The intake of foodstuff by school age children was generally lower among girls than boys although the differences were not high. Exception was observed for green leafy vegetable consumption, which recorded very high consumption among girls as compared to boys in the age group 7-9 years. Generally, males had higher consumption of foodstuff as compared to females (Table 10.4). Average intake of protein, calcium and thiamin was above the RDA while it was below the RDA for other nutrients in the age group 1-6 years. In the age group of 4-6 years, fat intake was also higher and was above the RDA. Compared to the RDAs, intake of all nutrients except protein, fat, calcium, vitamin C and thiamin was inadequate among both boys and girls in the age group of 7-9 years as well as in 10-12 years. The average intake of all nutrients except fat and thiamin among both boys and girls and

vitamin C among boys was inadequate in the age group of 13-15 years. However, nutrients intake was slightly in better state in the age group of 16-17 years, being above the RDA for protein and niacin among girls, calcium, thiamin and vitamin C among both boys and girls. As can be seen from Table 10.5, the problems of underweight and stunting are common among children in the districts across the state. Thus, nutrition of the children needs intense efforts for improvement of their nutritional status.

## **Education**

There are hardly any pre-primary schools in the state, indicating the need for greater emphasis on preschool education. Surprisingly, the number of primary schools in each district is much higher than the number of middle or high schools (Table-10.6). Similarly, the enrolment figures also show greater enrolment at primary school level than at higher levels. The effort required would be towards sustaining the primary school enrolments till higher levels of education. The availability of teachers is better at primary and high/ higher secondary school levels than that at the middle school level.

As evident from Table 10.7, the Teacher/ School ratio in middle school is extremely poor in the districts Kinnaur, Kullu, Lahul & Spiti, Mandi, Shimla and Sirmaur. While in most of these districts the likely problem is of retention of staff in remote & difficult areas but the same reason cannot be attributed for inexplicably low strength of teachers in middle schools of Shimla.

The paucity of teachers in almost all the middle schools in each district is adequately reflected in the student/ teacher ratio at the middle school level. The fall in the Student/ Teacher ratio at the high school level in most districts is attributed to the fall in student enrolment coupled with good staff strength of teachers in High school in all the districts.

## **Crimes against Children**

Both child rape (26) and kidnapping and abduction (24) were reported to be the most commonly committed crimes against children in the state (91) and constituted 55 percent of the crimes against children during 2002 (Table 10.8). Kullu district alone accounted for 32 percent of child rape, kidnapping and abduction cases among offences against children in the state. While child rape remained the most commonly reported offence (6 out of 7 cases). Other districts accounting for most cases of rape, kidnapping and abduction of children, alongwith Kullu, were Solan and Sirmaur. Nearly 29 percent cases of kidnapping and abduction of children occurred combinedly in Hamirpur and Kangra. Thus, child rape, kidnapping and child abduction are the major offences against children in the state. Special attention needs to be paid towards foeticide in Kangra, as all cases of foeticide in the state have been reported from this district. Perhaps special campaign against rape, child abduction and female foeticide is required in the districts Kangra, Solan, Shimla and Kullu to bring down the trend of crimes against children.

# Jammu & Kashmir

## State Highlights – Census, 2001

- There was growth in population of the State upto 1.3 percent.
- Barely 54.46 percent of the population in the state was literate.
- Female literacy was as low as 41.82 percent, as per census, 2001.

## *Highest and lowest population percentage of growth, literacy and sex ratio among the districts of the state*

Parameter	Highest	Lowest
* Total Population	Jammu: 1,588,772	Leh (Ladakh) : 117,232
*Literacy rate	Jammu: 77.30	Badgam: 39.54
*Sex ratio	Pulwama : 938	Leh (Ladakh) : 805

## Child Population (0-6 years)

The district-wise population and child population (0-6 years) is presented in Table 11.1. The average population of children in the state is around 14 percent but it varies among districts from 17 to 6 percent (Table 11.2). Around 16 to 17 percent of the population comprises of children in Punch (17.6%), Kupwara (17.0%), Udhampur (16.1%) and Rajouri (16.3%) and these districts require a concerted effort towards designing small families with healthy children through a socio-culturally relevant campaign. Barely 6.2 percent of child population comprises of children in Ladakh, which may be due to poor child survival in the polyandrous family system in the district.

## Sex Ratio

The sex ratio of the state is a matter of concern in all the districts (Table 11.3). In as many as 10 out of the 14 districts, the sex ratio is below 900. Perhaps, there is a serious need to gender sensitise the population all over the state to improve the gender balance in all the districts of the state. A special study can be undertaken to investigate the fall of sex ratio in Ladakh from 845 in 1991 to 805 in 2001, especially in view of the fact that the society in this area of the state is matriarchal and polyandrous by tradition.

## Education

As will be observed from Table 11.4, Rajouri has on an average less than 2 teachers per primary school, where as Srinagar has the Teacher/ School ratio of 6.4. This imbalance in manpower for

teaching in Primary Schools of Rajouri and Srinagar needs to be corrected. On studying the Student/ Teacher ratios for the 3 levels (Tables 11.4 & 11.5), it is observed that more teachers need to be recruited at Primary School levels. Only 44.9 and 32.5 percent of the children who had enrolled at the Primary School level reach Middle and High School, respectively.

### **Crimes against Children**

Nearly 74 percent of the crimes against children are committed in Anantnag district and three fourth of these are cases of kidnapping and rape, as evident from Table 11.6. The crime pattern of the offences against children reveals that more than half (54.8%) the crimes relate to kidnapping and abduction of children. Only 2 cases of foeticide were reported in the state, i.e., and one each in Poonch and Reasi. The one case of infanticide was registered in Anantnag.

# Jharkhand

## State Highlights – Census, 2001

- A marginal decline of 0.84 percent in decadal growth rate.
- Sex ratio improved by 19 points from 922 in 1991 to 941 in 2001.
- Average literacy for the state was 54.13 percent only.
- Female literacy was as low as 39.38 percent.

## *Highest and lowest population percentage of growth, literacy and sex ratio among the districts of the state*

Parameter	Highest	Lowest
* Total Population	Ranchi: 2,785,064	Lohardaga: 364,521
* Child population	Ranchi: 442,563	Lohardaga: 69,948
* Sex ratio	Gumla: 987	Dhanbad:819
* Literacy rate	East Singhbhum:69.42	Sahibganj: 37.91

## Child Population (0-6 years)

As can be seen from Table 12.2, the child population of the state is around 17.8 percent. However in Chatra, Giridih and Sahibganj one fifth of the population comprises of children (Table 12.1). In Palamu, Kodarma, Deoghar, Godda and Lohardaga, children constitute 19 percent or more of the population of the district. In contrast to these districts, only one tenth of the population in Pakaur district comprises of children.

Therefore, it would be worth while to study these contrasting patterns of child population across the districts, since the state came into existence after the 1991 Census and the child development strategies need a specific focus, based on scientific investigation of the socio-cultural milieu.

## Sex Ratio

Table 12.3 presents the district-wise sex ratio in Jharkhand. A rise of 19 points in the sex ratio of the state shows that there has been an improvement in the parameter. The extent of improvement in the sex ratio for districts is variable. Dhanbad has shown a significant improvement of 55 points in the sex ratio but still the figure is well below the 900 mark and is an indicator of the need to continue the measures adopted to improve sex ratio. The sex ratio has crossed the 1000 mark in Koderma (1001) and is the only such district in the state. The tribal societies of the state may

have contributed to reasonable gender balance in population of the districts Koderma (1001), Giridih (983), Lohardaga (976), Gumla (995) and West Singhbhum (976) which may be confirmed through a rapid appraisal study. It would also be interesting to investigate the reason behind the vast difference between the sex ratios of East Singhbhum (931) and West Singhbhum (976).

## **Education**

The state does not have any Pre-primary schools (Table 12.4) and therefore, it is important to ensure that the Anganwadis in this state with substantial tribal inhabitation function effectively. The number of schools at the Primary and Middle level need to be enhanced to cater to the needs of the children enrolled. The enrolment of children declines after the primary school level continuously and only 27 and 11 percent children of those enrolled earlier are seen at the Middle and High School levels, respectively. Apparently, there is a need to improve both, the infrastructure and enrolment of children in the sphere of education and more attention should be paid to it as Jharkhand is a tribal dominated state. As can be seen from Table 12.5, the Student/Teacher ratio at the Primary and Middle School level is abnormally high. These figures indicate the need for recruitment of more teachers to ease the burden on existing teachers, make teachers available in all schools in adequate numbers and to improve the quality of basic education.

## **Crimes against Children**

Dhanbad and Jamshedpur are the 2 districts which are crime-prone, as far as commission of crimes against children is concerned (Table 12.6). Around 45 percent of crimes against children have been reported from Dhanbad and nearly 20 percent from Jamshedpur. The most commonly reported offence against children is child rape (38.7%), followed by kidnapping and abduction (18.9%). Nearly 40 percent of the rape cases are in Dhanbad and around 28 percent are committed in Jamshedpur. Both these districts account for 86 percent of the kidnappings and child abductions in the state, each district sharing the proportion equally (42.9% each).

# Karnataka

## State Highlights-Census, 2001

- Decadal growth rate of population in the state is 17.25% during 1991-2001.
- Karnataka has a larger proportion of its population living in urban areas (33.98%) than the average for the country as a whole (27.78%).
- 51.55% of urban population in the state is male and 48.45 % females.
- 32.06% of urban population of the state is in Bangalore district, followed by Dharwad.
- Haveri district has witnessed the highest decadal growth rate of urban population with 46.69% over 1991.
- Sex ratio for total (964), rural (976) and urban (940) population of Karnataka is higher than the national average for the total (933), rural (946) and urban (901) populations of the country.

## ***Highest and lowest population, percentage of growth, literacy rate and sex ratio among the districts of the state***

<b>Parameter</b>	<b>Highest</b>	<b>Lowest</b>
* Total population	Bangalore: 6,537,124	Chamraj Nagar: 964,275
* Total rural population	Belgaum: 3,194,848	Kadagu: 470,099
* Total urban population	Bangalore: 5,759,917	Kadagu: 75,223
* Literacy rate	Bangalore: 83.91	Raichur: 49.54
* Sex ratio	Udupi: 1127	Bangalore: 906

## **Child Population (0-6 years)**

Table 13.1 gives the figures of total population and under-six population, as enumerated during Census, 2001. Nearly 12.94 percent of the total population of the state comprises of children in the age group 0-6 years. Koppal district has 17.09 percent of its rural population in the age group

0-6 years. The district also has the highest percentage (16.64) of total child population in the age group of 0-6 years. On the other hand, Udupi district has only 10.06 percent of its population aged 6 years or below. Bidar district has the highest percentage (15.13%) and Udupi has the lowest percentage (8.70%) of urban child population of 0-6 years. In the state as a whole, 11.80 percent of its total urban population is in the age group 0-6 years.

## **Sex Ratio**

Sex ratio in the state has showed improvement in Census, 2001 as compared to corresponding figures for Census, 1991 (Table 13.2). The parameter has improved for the total, rural and urban populations in the state. The three districts of Udupi (1127), Dakshina Kannada (1023) and Hassan (1005) have sex ratio favourable to females. Bijapur has an identical sex ratio of 949 among its rural, urban and total population.

## **Sex Ratio of Child Population (0-6 years)**

District-wise child sex ratio for under-six population is presented in Table 13.2. There is a serious cause of concern in the finding that the sex ratio in the age group 0-6 years has registered considerable decrease from 960 in 1991 to 949 in 2001. In Kodagu district there are 977 females for every one thousand male children in the age group 0-6 years. The lowest sex ratio for this age group has been reported in Belgaum district (924). Among the rural child population upto 6 years, Bijapur has the highest sex ratio (986) and the lowest figure is reported for Belgaum (924). Among urban population figures for children aged 6 years and below, the sex ratio is highest in Kodagu (986) and lowest in Bagalkot (910). A detailed study needs to be conducted to establish the reasons leading to a considerable fall in the sex ratio among children aged 0-6 years.

## **Education**

As can be observed from Table 13.3, the number of middle schools in each of the districts far exceeds the number of primary and middle schools, whereas the enrolment figure show that the number of children enrolling at the primary school level is much higher than the middle school level. Therefore, there is a need to build up greater infrastructure of the primary schools across the districts, with the help of the Panchayati Raj Institution.

Most districts have 2 or less than 2 teachers at the primary school level (Table 13.3) and the situation calls for recruiting more primary school teachers to promote elementary education of children. As can be observed from Table 13.4, the student/ teacher ratio is invariably high in all the districts, which can only be corrected by opening more primary schools in each district and recruiting adequate number of teachers at primary school level.

## **Coverage of Children under NCLPs**

Three districts, namely, Bijapur, Raichur and Dharwad have NCLP projects, covering 1950 child labourers through 39 schools against a sanction of 110 schools for 5500 child labourers in the state (Table 13.5). Clearly, the inputs for educating child labour and improving their situation are far from adequate and efforts are required to operationalise the schools and enroll more child labourers in terms of the sanctioned parameters to have an impact on child labourers.

It is disturbing to note that no school has been opened against the 40 schools sanctioned for the district to cover 2000 children. Thus, there is a serious need to look into the impeding factors in implementation of NCLP project in the state and tackle the conditions that obstruct operationalising schools for child labour that have been sanctioned so far.

## Crimes against Children

Table 13.6 indicates that about 25 percent of the crimes against children are murders, followed by kidnapping and child abduction (20%), child rape (17%), abandonment of children (9%), foeticide (6%) and procurement of minor girls (6%). Most crimes against children were reported from Belgaum (17%), Raichur (14%), Dharwad (12%), Chickmagalur (11%) and Bangalore (9%). As many as 52 percent cases of murders of children took place in Belgaum. Nearly 42 percent of child rapes were reported from Chickmagalur. All the 7 percent cases of foeticide that came to light were from Dharwad. The districts of Bidar, Bharwad and Raichur collectively accounted for about 52 percent cases of kidnapping and abduction. Half (5 out of 10) the cases of abandonment of children were from Bidar. Thus, while designing any intervention on crimes against children, the focus should be on female foeticide and kidnapping/ abduction of children in Dharwad; on child rapes in Chickmagalur and Bangalore.

# Kerala

## State Highlights – Census, 2001

- The growth rate of state population has been only 9.42 percent during the decade 1991-2001.
- There had been decline in growth rate of population in all districts of Kerala.
- Sex ratio for the state has been reported as 1058, which is higher than the national sex ratio and highest among Indian states.
- The literacy rate recorded for the state is 90.92 percent and female literacy has been reported to be as high as 87.86 percent.

## *Highest and lowest population, percentage of growth, literacy rate, sex ratio and density among the districts of the state.*

Parameter	Highest	Lowest
* Total population	Malappuram: 3,629,640	Wayanad: 7,86,627
* Total rural population	Malappuram: 3,273,657	Wayanad: 7,57,025
* Total urban population	Ernakulum; 1,476,488	Wayanad: 29,602
* Percentage of population growth (%)	Malappuram: 17.22	Pathanamthitta: 3.72
* Literacy rate (%)	Kottayam: 95.90	Palakkad: 84.31
* Sex ratio (females/ 1000 males)	Pathanamthitta: 1094	Idukki: 993
* Density (Person per sq. km.)	Alappuzha: 1489	Idukki: 252

## Child Population (0-6 years)

The population and the child population of the state for each district is indicated in Table 14.1. The percentage of child population in the age group 0-6 years is 11.48 percent in the state (Table 14.2). Around 11.68 percent rural population comprises of children in the age group 0-6 years, while children aged 6 years or below constitute 10.90 percent of the urban population. The percentage of male children aged 0-6 years is higher in both rural and urban areas. Among the districts of the state, the percentage of child population in the age group 0-6 years is highest in

Malappuram district (14.64%) and lowest in Pathanamthitta district (9.93%) and this trend is observed in the rural-urban break up of population in the age group 0-6 years in the Census 2001 data.

## **Sex Ratio**

Kerala has a unique position with respect to the sex ratio of the country and other Indian states. It is the only Indian states that has consistently maintained sex ratio above the equality ratio over the past century. During census 2001, Kerala reported sex ratio of 1058 for the whole state (Table 14.3). The highest sex ratio was reported in Pathanamthitta (1094) and lowest in Idukki (993). All the districts have shown a gain in sex ratio in favour of females during the last decade, as per Census data of 1991 and 2001. It would be interesting and useful to study the reason behind the only district of Idukki returning a sex ratio of 993, while all the other 12 districts of Kerala having a sex ratio of 1000 or above. It is also important to note that the sex ratio in urban Idukki (1014) is higher than that of rural Idukki (991).

## **Sex Ratio of Child Population (0-6 years)**

The sex ratio of population in the age group 0-6 years in the state is only 963 girl children against every 1000 boy children, as evident from Table 14.3. In rural areas of Kerala the sex ratio of children aged 6 years and below is 964, while the sex ratio for the same population group in urban areas has been reported to be 958. The sex ratio of child population in the age group 0-6 years is highest in Kasaragod (984) among the districts of Kerala and is mainly due to its urban component (1004) that is reported to be higher than the rural component for the district and the state. Ernakulam has the lowest sex ratio of 948 for the population in the age group 0-6 years and its urban component has a higher figure than the rural component. While the sex ratio for the total population of the state shows higher sex ratio in rural areas than urban areas, the trend is reverse in case of child population in the age group 0-6 years in the case of Kasaragod, Wayanad, Kozhikode, Thrissur, Ernakulam, Idukki and Kottayam. This reverse trend needs to be deeply studied to identify the underlying factors.

## **Education**

The Teacher/ School ratios and Student/ Teacher ratios for each of the districts in the state, as worked out in Table 14.5 are better than most states of the country, indicating a better provision of infrastructure and manpower for education. Even in Kerala, it is observed (Table 14.4) that enrolment declines as one moves from elementary education to Middle and High School. Thus, the emphasis in the entire state should be on retention in schools and completing school education for better employment prospects.

## **Crimes against Children**

Child murder (26.7%) is the most commonly reported crime in the state (Table 14.6), followed by child rape (22.5%) and kidnapping and abduction (12.9%). Nearly one-fifth of the offences against children have been reported from Kollam and Pallakad accounts for 14.6 percent crimes against children. One third of the child rape cases occur in Kollam and other districts reporting considerable number of child rapes in the state are Pallakkad (16.6%), Malappuram (11.1%) and Trivandrum (11.1%). The lone case of infanticide was reported from Ernakulam and 2 cases of foeticide were from Pallakkad. Two-third of the cases of child marriage were reported from Kozhikode. The campaigns against child rape and child marriage need to focus on the districts discussed above as the major venues of specific crimes against children.

# Madhya Pradesh

## State Highlights – Census, 2001

- The decadal population growth for the state has been 24.34 percent.
- The sex ratio of 920 for the entire population of the state is lower than that for the country.
- The literacy rate in the state is as low as 44.67 percent.
- Around 19.94 percent of the population in the state are in the age group 0-6 years.

## *Highest and lowest population, percentage of growth, literacy rate, sex ratio and density among the districts of the state*

Parameter	Highest	Lowest
* Total population	Indore: 2,585,321	Harda: 4,74,174
* Total rural population	Sidhi: 1,569,163	Bhopal: 3,57,665
* Total urban population	Indore: 1,850,311	Dindori: 26,862
* Percentage of population growth	Indore: 40.82	Balaghat: 5.85
* Literacy rate	Narsingpur: 78.34	Jhabua: 37.08
* Sex ratio	Balaghat: 1022	Murena: 822
* Density	Indore: 663	Dindori: 78

## Child Population (0-6 years)

Madhya Pradesh ranks 5<sup>th</sup> in the country in terms of the size of its population in the age group 0-6 years (Table 15.1), and accounts for 6.72 percent of India's child population this age group (Table 15.2). The child population in the age group 0-6 years in the state has grown by 9.46 percent. Rural child population below 7 years of age has increased by 10.39 percent and in urban areas by 6.22 percent. While child population in age group 0-6 years in Badwani has increased by 27.15 percent, it has reportedly decreased by 18.44 percent in Dindauri. The greatest percentage of children aged 0-6 years in the district level population are in Jhabua (22.52%), followed by Badwani (22.25%) and Siddhi (20.42%). Indore is the district having the lowest percentage of population in the age group 0-6 years (14.18%), followed by Balaghat (15.12%), Gwalior (15.24%) and Bhopal (15.37%).

## Sex Ratio

As can be seen from Table 15.3, the sex ratio for the whole state has been computed as 920 during Census, 2001. Within the state only two districts have reported the sex ratio of above 1000,

namely, Balaghat (1022) and Mandla (1002). In 26 districts of Bhind (829), Morena (822), Gwalior (847), Sheopur (893), Shivpuri (858), Datia (858), Guna (885), Tikamgarh (886), Chhatarpur (869), Sagar (884), Vidisha (876), Bhopal (896), Raisen (880) and Hoshangabad (898) the sex ratio was found to be below 900. In the Chambal Division the sex ratio averaged to 836 only. The rural sex ratio is much lower than the urban ratio in most these districts which needs to be investigated.

### **Sex Ratio of Child Population (0-6 years)**

As evident from Table 15.4, the sex ratio for child population in the age group 0-6 years is better than that for the entire population of the state. In 32 districts including Sheopur, Bhind, Gwalior, Datia, Shivpuri, Chhatarpur, Panna, Damoh, Satna, Nimach, Ujjain, Rattam, Shajapur, Dewas, Jhabua, Dhar, Indore, West Nimar, Badwani, East Nimar, Rajgarh, Vidisha, Sehore, Raisen, Betul, Harda, Hoshangabad, Katni, Dindori, Mandla, Chhindwara and Balaghat the sex ratio of rural children under 7 years of age is higher than their urban counterparts. It would be essential to conduct a rapid appraisal of these districts to confirm the prevalence of female foeticide using sex determination techniques in the urban areas in view of the wide gap between sex ratio of urban and rural children aged 0-6 years. Serious thought has to be given to gender-specific interventions in these districts.

### **Education**

The enrolment of children declined by 67.5 percent and 81.7 percent at the Middle and High School levels, respectively, (Table 15.5) indicating the urgency of adopting measures to enhance enrolment of children in every district (as such a trend is observed in each district). The Student/Teacher ratio (Table 15.6) indicates that the number of teachers for primary schools education is inadequate and more teachers are required to ensure quality education at that level.

### **Coverage of Children under NCLPs**

NCLPs are operational in seven districts of the state and of the 187 schools sanctioned for child labour (Table 15.7). Only 81 are operational, benefiting just 4,358 children out of the 12,500 proposed. While 3 districts, namely Surguja (58.2%), Mandasaur (55.7%) and Raigarh (50.0%) cover half or more of the targetted child population, 3 more districts of Durg (35.0%) cover 30 to 35 percent of the target. Therefore, motivational campaign for enhancing enrolment of child labour in schools under NCLPs. A special focus is required for operationalizing the 40 schools sanctioned under the NCLP in Guwalior for educating 2000 child labourers.

### **Crimes against Children**

The districts Guna (8.8%), Ujjain (6.9%), Khandwa (6.4%), Chhatarpur (5.7%) and Bhind (5.0%) collectively account for one-third crimes against children in the state, as evident from Table 15.8. Child rape was the most common offence (22.2%), followed by kidnapping and abduction of children (6.6%). Only 4 cases of foeticide were reported, one each from the districts Betul, Datia, Mandla and Panna. Therefore, specific focus of gender sensitization campaigns in these 4 districts should cover issues related to female foeticide while tackling offences against children and more specifically, the girl child should be the concern in strategic intervention in Guna, Ujjain, Khandwa, Chhatarpur and Bhind.

# Maharashtra

## State Highlights-Census, 2001

- The population of the state has grown by 22.57 percent.
- The decadal growth rate has fallen by 3.16 percent.
- The sex ratio for the total population in the state has fallen by 12 and stands at 922 during Census, 2001.
- Literacy rate has risen for the state to 77.27 percent.

## *Highest and lowest population, percentage of growth, literacy rate, sex ratio and density among the districts of the state*

Parameter	Highest	Lowest
* Total population	Mumbai: 8,587,561	Sindhudurg: 861,672
* Percentage of population growth (Decadal growth rate)	Sindhudurg: 3.55	Thane: 54.86
* Literacy rate	Mumbai (suburb): 87.14	Dhule: 56.06
* Sex ratio	Ratnagiri: 1135	Mumbai: 774
* Density	Mumbai: 21190	Gadchiroli: 67

## Child Population (0-6 years)

The district-wise detail of child population, as enumerated during Census, 2001 is given in Table 16.1. Child population comprises 13.6 percent population in the state (Table 16.2). The districts of Kolhapur (17.8%), Nandurbar (16.8%), Hingoli (16.4%) and above the average for child population. On the other there are districts like Wardha (12.1%), Nagpur (12.6%) and Pune (12.8%) with lower proportion of child population. It would be useful to study the phenomenon of greater than usual proportion of children in certain districts, as well as the reasons for lesser percentage of child population in certain districts indicated above. The most likely cause of abnormally low percentage of child population in Mumbai (9.8%) and its Suburbs (11.5%) is the considerable influx of migrant population of adult males working in the city, with their families residing in rural areas of the country.

## **Sex Ratio**

The average sex ratio of Maharashtra has shown a declining trend. In the last century, the sex ratio in the state has fallen by 56 points and during the last decade the sex ratio has fallen to an all time low of 933 due to further decline by 12 points. Most districts are above the state average. Ratnagiri (1135) has the highest sex ratio among the districts of the state, followed by Sindhudurg (1077). The lowest sex ratio is observed in Mumbai (774), Mumbai Suburb (826) and Thane (857), as per Table 16.3.

During the last decade (1991-2001), as many as 23 districts have registered a decline in sex ratio and 10 districts have shown an increase in sex ratio. Significant decline has been observed in Ratnagiri (-70), Sindhudurg (-60), Raigarh (-35), Satara (-34), Thane (-22) and Mumbai (-17). Appreciable increase has been reported from districts of Chandrapur (+13), Nagpur (+11) and Gondiya (+10). While in most cases of significant drop in sex ratio of districts, the sex determination test followed by termination of pregnancy leading to female foeticide could be a major cause that needs to be confirmed. In addition to this, the gender composition of the migrant population moving to the urban industrial centres of these districts has to be taken into consideration.

## **Education**

In most districts of the state, the pre-primary and primary schools do not always have even 2 teachers in the school (Tables 16.4 & 16.5) as evident from the teacher/ school ratio for the districts. As can be seen from the district-wise student/ teacher ratio, all states have inadequate number of teachers in comparison to the number of students enrolled. Thus, there is a clear requirement of recruiting more teachers at the primary and pre-primary levels.

## **Coverage of Children under NCLPs**

As many as 61 of the 74 sanctioned schools for child labour were functional, catering to the needs of 3170 children (Table 16.6). A little more effort would be required to operationalize the remaining 13 schools that have been sanctioned to increase the coverage of child labour to 3700 children under the NCLP schemes in the state.

## **Crimes against Children**

Child rape, murder, kidnapping & child abduction, exposure and abandonment account for nearly 70% of crimes against children in the state (Table 16.7). Child rape constitutes 26.4 percent crimes against children in Maharashtra, followed by exposure and abandonment of children (15.2%), kidnapping and abduction of children (14.8%) and murder (13.3%)

The districts Nagpur rural (38), Pune commissionerate (37), Nasik rural (27), Pune rural (27), Bhandara (24), Sangli (23) and Wardha (21) accounted for more than 40 percent of child rapes in the state. Most cases of child exposure and abandonment were reported from Jalgaon (23), Nasik rural (22), Nagpur Rly. (21), Pune rural (21) and Pune commissionerate (19). Maximum cases of kidnapping and abduction of children were reported from Mumbai, Yavatmal, Nagpur, Buldhana, Sangli and Wardha which summed up to nearly 41 percent cases of this crime. Stray cases of foeticide have been reported in Aurangabad, Dhule, Mumbai, Chandrapur and Nasik rural despite legislation to prevent it. Most cases of procurement of girls were from Sangli (12), Navi Mumbai (7) and Gadchiroli (6). Buying and selling of girls for prostitution was reported in Pune and Sangli, receptively.

On the whole, there is a need to raise the level of awareness among masses against crimes perpetrated on children and stepping up prevention of crimes against children. Specific campaigns may be launched in various districts in reference to the crime pattern reported from the given district. Focus of intervention against crimes affecting children may be on Mumbai, Aurangabad, Sangli, Kolhapur, Jalgaon, Gadchiroli, Nasik, Pune and Yavatmal districts.

# Manipur

## State Highlights – Census, 2001

- The state registered a rise of less than 1% in decadal growth rate (from 29.29 to 30.02).
- Female literacy was nearly 60 percent for females in the state.
- There has been an improvement in the sex ratio by 20 points during the decade 1991-2001.

## *Highest and lowest population percentage of growth, literacy and sex ratio among the districts of the state*

Parameter	Highest	Lowest
* Total Population	Imphal West: 4,709,851	Tamenglong: 111,493
* Literacy rate	Imphal West: 80.61	Senapati:50.47
*Sex ratio	Imphal West: 1,007	Tamenglong:922

## Child Population (0-6 years)

The average population of children in the state is around 13 percent (Table 17.2). The lowest proportion of children was observed in Tamenglong and it would be useful to find out the reasons behind it and identify the factors which make this district different in the matter of child population in comparison to the other districts (Table 17.1). On the other hand, it would be interesting to study the factors leading to a high proportion of child population in Thoubal district.

## Sex Ratio

Though almost all the districts in the state registered sex ratio above 900 and performed better in 2001 Census on an average, as compared to the 1991 Census, yet Senapati district is a cause of concern (Table 17.3). It is the only district in the state that reported a fall in sex ratio (from 935 in 1991 to 922 in 2001) and the demographic or social factors underlying such a decline have to be identified. Two districts namely Tamenglong and Thoubal have registered sex ratio above 1000 and can form interesting case studies in improving sex ratio.

## Nutrition

Across the eight districts in the state, on an average, cereals as well as the green leafy vegetables were adequately consumed. The inadequacy of consumption of other foodstuffs in various district across the state is presented in Table 17.4. The dietary inadequacy of protein rich foods like

pulses and milk/ milk products is a matter of great concern. A campaign on increasing consumption of protein rich foods is essential throughout the state. The districts with inadequacy status of protein and calorie are listed in Table 17.5. As can be seen, the inadequacy of protein and calories declines as we move from childhood to adolescence. Thus, the focus should be on better infant and child feeding during nutrition and health education sessions in the state. The Prevalence of severe undernutrition at the district level is presented in Table 17.6. All districts have undernourished population, though of variable degree, calling for intervention accordingly. The prevalence of underweight, stunting and wasting at district level is shown in Table 17.7. Imphal had the highest prevalence of the problem of underweight children, followed by Tamenlong and Ukhruel having greatest proportion of stunted children, indicating chronic malnutrition. Districts with prevalence of chronic energy deficiency are listed in Table 17.8. The districts of Tamenlong, Chandel, Imphal, Senapati and Thoubal are a cause of concern when districts with unmet energy needs are considered and programmes of supplementary nutrition and food for work need to be implemented with greater rigor in these districts.

Table 17.9 presents the nutritional situation of the children across the districts in the state. To sum up, at the district level, proportion of normal children was highest in Churachandpur (40%) and lowest in Imphal (20%). The prevalence of mild undernutrition varied from 35 percent in Imphal to 49 percent in Senapati and Thoubal districts and moderate degree undernutrition between 17 percent in Churachandpur to 39 percent in Imphal district. Severe degree undernutrition was however highest in Tamenglong district (7%) followed by Ukhruel (5.7%), Imphal (5.4%), Churachandpur (5.1%) and Bishenpur (5.0%). The lowest prevalence of severe undernutrition was seen in Senapati district (2%). It was about 3 percent each in Thoubal and Chandel districts.

## **Education**

The manpower and infrastructure for education seems to be adequate in the state, as evident from Tables 17.10 and 17.11. The absence of pre-schools in most districts underlines the significance of Anganwadis in the state as the only source of early childhood stimulation and education. The main concern is a steep decline in enrolment at Middle School level (57.5%) and further decline at the High School level (71.8%), when the figures of enrolment of children are compared at these levels with those at the Primary School level. Thus, the focus of child education has to be to retain children in school beyond Primary School and for this parent and the community has to be made to appreciate the importance of completing school education.

## **Crimes against Children**

No offences have been reported to have been committed against children (Table 17.12).

# Meghalaya

## State Highlights – Census, 2001

- The decadal population growth for the state reported during the decade 1991-2001 is 29.94 percent.
- The state has sex ratio of 975, which is well above the national average and notably higher is the urban sex ratio of 985.
- Sex ratio of children in the age group 0-6 years is the same (975) as that for the entire population but the urban sex ratio of children aged upto 6 years is much lower (964).

## *Highest and lowest population, percentage of growth, literacy rate, sex ratio and density among the districts of the state.*

Parameter	Highest	Lowest
* Total population	East Khasi Hills: 6,60,994	South Garo Hills: 99,105
* Total rural population	West Garo Hills: 4,57,422	South Garo Hills: 90,462
* Total urban population	East Khasi Hills: 2,77,967	South Garo Hills: 8643
* Percentage of population growth	East Khasi Hills: 42.05	Ri Bhoi: 6.83
* Literacy rate	East Khasi Hills: 74.74	West Garo Hills: 50.78
*Sex ratio	West Garo Hills: 988	South Garo Hills & Ri Bhoi: 941

## Child Population (0-6 years)

Child population in the age group 0-6 years comprises 19.8 percent of the total population. As evident from Table 18.1, the number of boys (2,31,571) is slightly higher than the number of girls (2,25,871). Nearly 86 percent of children aged 0-6 years reside in rural areas and 14 percent are in urban areas. The child population in the age group 0-6 years is highest in East Garo Hills (1,12,374) and lowest in South Garo Hills (20,892).

## Sex Ratio

The sex ratio for the state is 975, as reported in Census, 2001. The districts West Garo Hills (988), East Khasi Hills (984) and Jaintia Hills (980) returned sex ratios higher than the state average (Table 18.2). The cause of concern for developmental scientists would be the districts Ri Bhoi (941), South Garo Hills (941) and East Garo Hills (960) where sex ratio was reported to be much below the state average. However, all the districts have a sex ratio higher than the sex ratio for the country as a whole.

## **Sex Ratio of Child Population (0-6 years)**

The sex ratio for children in the age group 0-6 years is the same (975) as the sex ratio for the entire population. However, there is a need for investigating reasons for a much lower sex ratio in the districts South Garo Hills (947) and West Garo Hills (958). It is significant to note that the West Garo Hills returned a sex ratio of 988 for the entire population during the Census, 2001 but the sex ratio for its child population was as low as 958. The problem of low sex ratio of entire population (941) as well as the child population upto 6 years (947) requires special attention in South Garo Hills. Equally interesting would be the study of factors leading to low sex ratio of general population (941) but highly favourable sex ratio for girl children upto 6 years (989) in Ri Bhoi. The best practices and the favourable conditions leading to high sex ratio for the entire population (980) and child population upto 6 years (994) require to be documented after detailed study of the underlying factors.

## **Nutrition**

Districts with inadequate average consumption (g/cu/day) of various foodstuff is listed in Table 18.3. The fact that both cereals and pulses were not adequately consumed in all the districts should alarm all nutritional planners, as cereal pulse combination is vital in forming the nutritional base of populations which are economically not so well off.

Emphasis during the nutrition and health education sessions should be on use of various cereal-pulse combinations as the staple diet, supplemented by other foodstuffs.

The districts with inadequate average intake of different nutrients (cu/day) are listed in Table 18.4. As can be seen, population in all the districts is consuming insufficient food to meet even the basic energy requirements and thus, we cannot even expect them to utilise their protein intake efficiently. The protein and calorie adequacy in the districts is depicted in Table 18.5. The energy-protein deficit decreases with increasing age and adolescents show lesser deficit than children. Thus basic diet counseling and nutrition education to mothers on infant and child feeding is essential to improve the nutritional intake across the age groups. The Table 18.5 clearly depicts the improved protein adequacy status in Khasi group of districts, Jaintia Hills and Ri-bhoi districts as compared to Garo group of districts. It is also quite apparent that a large section of population had calorie inadequacy in all the districts of the state as compared to protein inadequacy.

## **Education**

The average student/ teacher ratio was observed to be low at High School level due to relatively lower proportion of students being enrolled even when the number of teachers recruited was not high (Tables 18.6 & 18.7). On the other hand, student/ teacher ratio was better in Primary & Middle Schools. The data shows that enrollment of students at Middle and High School level which falls by about 70.6 percent and 82.7 percent and may be enhanced through special drives to promote completion of school education, using various media to reach and convince the community.

## **Crimes against Children**

Only one case of child rape was reported from the state and therefore, the state may be presumed to be safe for children (Table 18.8).

# Mizoram

## State Highlights – Census, 2001

- The population growth rate for Mizoram was reported to be 29.18 percent.
- While 75.85 percent men in the state are literate, only 54.16 percent women are literate.
- The sex ratio of the state (938) is slightly higher than the national figure of 933.
- Nearly 15.88 percent of the population is in the age group 0-6 years.

### ***Highest and lowest population, percentage of growth, literacy rate, sex ratio and density among the districts of the state.***

<b>Parameter</b>	<b>Highest</b>	<b>Lowest</b>
* Total population	Aizwal: 3,39,812	Sercchip: 55,539
* Percentage of population growth	Aizwal: 39.24	Maamit: 3.49
* Literacy rate	Aizwal: 96.64	Lavanglaaye: 54.46
* Sex ratio	Champhaaye: 955	Lavanglaaye: 901
* Density	Aizwal: 95	Maamit: 21

## Child Population (0-6 years)

Around 15.88 percent of the population comprises of children in the age group 0-6 years. As evident from Table 19.1, the number of boys (71817) is slightly higher than the number of girls (69,720). Aizwal has the maximum number of children (47,473) and Sercchip has the least number of children (9115).

## Sex Ratio

Mizoram has shown improvement (from 921 to 938) in the sex ratio over the decade, 1991-2001. The district Lavanglaaye (901) has the lowest sex ratio and Champhaye (955) has the highest sex ratio (Table 19.2). While sex ratio in Lavanglaaye district has shown improvement over the decade (from 891 in 1991 to 901 in 2001), sex ratio of Champhaye has declined from 969 to 955 during the decade, 1991-2001. The notable improvement in sex ratio of Saiha (from 939 in 1991 to 954 in 2001) and Aizwal (from 917 in 1991 to 954 in 2001).

## **Nutrition**

The districts with inadequate food consumption are listed in Table 19.3. Population in all the districts consumes less than the recommended quantities of cereals and milk/ milk products. The average nutrient intake per consumption unit in the state is presented in Table 19.4. The inadequacy of dietary iron in all the districts calls for an intensified campaign of distributing and promoting consumption of iron and folic acid tablets to maintain productivity levels of the human resource and to keep anemia at bay. Energy deficient diets indicate gross food insufficiency in the state across the districts and a substantial possibility of diversion of proteins in the diets to make up inadequate calories in the diet. The prevalence of underweight, stunting and wasting of children at the district level are shown in Table 19.5. In a state where every district has population consuming inadequate amount of calories, it is not surprising that around 40 percent children manifest features of stunting.

The Table 19.6 indicates the intake of nutrients according to age and sex. The average intake of all nutrients except energy and iron among the children of 1-6 year age was adequate being above their RDAs. On an average, nutrients intake was higher among boys in the age group of 1-3 years while it was lower in the age group of 4-6 years except for protein. The average energy and iron intake was below the level of their respective RDAs. The remaining nutrients were adequately taken on an average by both boys and girls. The average intake of all the nutrients had been adequate among adolescents and adults except for iron. The intake of iron had been inadequate in all the age groups.

Table 19.7 presents the protein calorie adequacy status of children and adolescents. The dietary inadequacy of energy and proteins is made up as the child grows. Thus, proper infant and child feeding practices should be the focus of nutrition and health education in the state.

## **Education**

District-wise data was not available for the state (Table 19.8). The overall figures reveal that the infrastructure was inadequate at both the Middle and High School level and the teachers were also inadequate. The substantial decline of 63.2 percent and 73.1 percent, at the Middle and High School levels, respectively, as compared to Primary School level resulted in very low Student/ Teacher ratios of 8.6 and 10.8 for the 2 levels (Table 19.9).

## **Crimes against Children**

No crime was reported to have been committed against children in the state during the year 2002 (Table 19.10).

# Nagaland

## State Highlights – Census, 2001

- The state reported the decennial growth rate of 64.41 during the period 1991-2001.
- The district of Wokha recorded a growth rate of 95.01 percent during the period covered under Census, 2001.
- Though the sex ratio for the total population of the state has consistently risen and stands at 909 during Census, 2001, it still continues to be below the national figure of 933 for the period.

## *Highest and lowest population, percentage of growth, literacy rate, sex ratio among the districts of the state*

<i>Parameter</i>	<i>Highest</i>	<i>Lowest</i>
* Total population	Tuensang: 414,801	Phek: 148, 246
* Percentage of population growth	Wokha: 95.01%	Phek: 45.12%
* Literacy rate	Mokokchung: 84.27%	Mon: 42.25%
* Sex Ratio	Zunheboto:945	Dimapur: 854
* Density of population (Persons per sq. k.m.)	Dimapur: 333	Phek: 73

## Child Population (0-6 years)

Children upto six years of age comprise 14.1 percent of the population in the state ( Tables 20.1 & 20.2). The child population in districts of Phek (17.8%) and Zunheboto (16.0%) is observed to be higher than the state average and it would be worthwhile to investigate the reasons for it.

## Sex Ratio

Except Zunheboto all other districts have shown an improvement in sex ratio over the 1991 figures. Though Zunheboto still has the highest sex ratio (945) in the state yet it would be essential to investigate the behind the fall in sex ratio in the district from 964 in 1991 to 945 in 2001

(Table 20.3). Only 2 districts, namely, Mon (881) and Dimapur (845) have sex ratio below 900. A special study could be undertaken to explore the underlying causes.

## **Nutrition**

The protein and calorie adequacy status of children and adolescents is depicted in Table 20.4. About 5 percent of boys and 9 percent of girls had adequate (p+c+) intake of both protein and calorie intake while around half of the boys (51%) and girls (48%) had inadequate (p-c-) intake of both. Protein, by itself, was adequately taken by around half of the children (boys 49%, girls 52%) but calorie adequacy was same as above (boys 5%, girls 9%). With increase in age, protein calorie adequacy status improved since 35 percent of boys and 27 percent of girls had adequate (p+c+) intake of protein and calorie and 11 percent boys and 17 percent girls had inadequate (p-c-) intake of both. Protein alone was adequately taken by 89 percent boys and 83 percent of girls. However calorie intake status remained same as above (boys 35%, girls 27%).

Districts with prevalence of severe undernutrition are listed in Table 20.5. As can be seen from the Table, Mokokchung district needs special intervention to overcome high prevalence of severe undernutrition. District-wise prevalence of underweight, stunting and wasting is shown in Table 20.6. While Mokokchung and Zuheboto have a serious problem of underweight and wasting among children, Wokha has a chronic nutritional problem of stunting among children.

## **Education**

There are no Pre-primary schools in the state (Table 20.7) and therefore the preschool component of ICDS assumes greater significance in early childhood education. Table 20.8 indicates that the average Student / Teacher ratio is high for the state at Primary level. Thus, more primary school teachers are required to be recruited. The greater cause of concern is the fall in enrolment figures by 69 percent at Middle School level 8.15 percent at High School level. The burning issue, therefore, is of retention of children in school after Primary School level.

## **Crimes against Children**

There was no reported crime against children in the state, as reflected in Table 20.9, pertaining to the data collected for the year 2002.

**Table 20.1 : Population in the Age-Group 0-6 Number of Literates and Literacy Rate for State and Districts, 2001**

# Orissa

## State Highlights – Census, 2001

- Around 85.03 percent of the population of the states resides in its rural areas.
- The sex ratio of the state (986) is better than the National sex ratio (946).
- Nearly 14.11 percent of the population of the state comprises of children in the age group 0-6 years.
- Sex ratio of children in the age group 0-6 years (950) is lower than the sex ratio of the entire population (986) in the state but higher than the National sex ratio for children aged 0-6 years (927).

## ***Highest and lowest population, percentage of growth, literacy rate, sex ratio and density among the districts of the state***

Parameter	Highest	Lowest
* Total population	Ganjam: 3,136,937	Debagarh: 2,74,095
* Total rural population	Ganjam: 2,598,746	Debagarh: 2,54,010
* Total urban population	Khordha: 8,04,775	Bawdh: 17,996
* Percentage of population growth	Khordha: 24.79	Bolangir: 8.52
* Sex ratio	Gajapatti: 1031	Cuttack: 938

## Child Population (0-6 years)

Children comprise 14.1 percent of the population in the state (Table 21.1). The districts Debagarh (15.1), Kendujhar (15.2), Mayurbhanj (16.0), Gajapati (17.3), Kandhamal (17.7), Baudh (15.8), Kalahandi (15.8), Rayagada (17.1), Nabarangapur (17.7) had 15 to 17 percent population as children. Perhaps, high child mortality could be a reason for bearing more children to secure survival of a few. On the other hand, Bargarh (12.5), Jharsuguda (12.6), Sambalpur (12.7), Jagatsinghapur (11.3), Cuttack (11.7), Nayagarh (12.8), Khurda (11.9) and Puri (12.1) have only 11 to 12.5 percent of the population constituting their child population. It needs to be investigated whether the comparatively lower percentage of child population is due to migration of children to cities in the state and in other parts of the country as child labour.

## **Sex Ratio**

Table 21.2 gives comparative figures for sex ratio of general population and children below six years. It is encouraging to observe that sex ratio in all the districts of the state is above 900 and in districts Kendrapara (1014, Ganjam (1000), Kandhamal (1008), Nuapada (1006), Kalahandi (1000) and Rayagada (1029) it is above 1000.

### **Sex Ratio of Child Population (0-6 years)**

Only one district in the state, namely, Nabarangapur (1002) has child sex ratio above 1000 (Table 21.2). The districts where there is a visible difference between average, rural and urban sex ratio of children in the district should be the focus of gender-based interventions. Some such districts are Jharsuguda, Sambalpur, Jagatsinghapur, Angul, Nayagarh, Gajapati, Kandhamal, Baudh, Bolangir, Rayagada, Nabarangapur and Koraput.

## **Education**

The Student/ Teacher ratio at the Primary and Middle School level shows that number of teachers recruited at those 2 levels are inadequate for the number of students enrolled (Table 21.4). There is a decline of around 68 and 75 percent in enrolment at the Middle and High School levels (Table-21.3), calling for intensifying the drive to reduce school dropout after Primary School level.

## **Child Labour**

The National Child Labour Projects (NCLPs) run in as many as 18 districts of the state and 570 schools have been sanctioned for child labour, of which 511 are operational (Table 21.5). Due to 59 schools yet to come in existence, 5294 children involved in labour do not have access to education. Despite sanction of 40 schools each, in the 2 district of Cuttack and Balasore, no schools are functional in these districts. Therefore, special emphasis has to be laid on making the sanctioned schools operational in Cuttack and Balasore.

## **Crimes against Children**

Child rape was the most common (37.5%) crime in the state, followed by kidnapping and child abduction (14.3%) and child murders (12.5%). Maximum reports of crimes against children poured in from Rayagada (17.9%) followed by Jharsuguda (14.3%) in terms of total crime reported from the state (Table 21.6). About 38 percent cases of child rape were reported from Rayagada alone. Thus, emphasis should be on gender issues with a specific focus on prevention of rape of the girl child and changing the mind set through social action.

# Punjab

## State Highlights – Census, 2001

- While the state constitutes of about 1.5 percent of country's area, it has 2.37 percent of country's population.
- Punjab has a very low sex ratio (874) as compared to the national average and sex ratio of most states in the country.
- Even though the sex ratio of the state had a rising trend till 1991, it showed a decline from 882 in 1991 to 874 in 2001.
- There has been 19.76 percent decadal growth in Punjab.

## ***Highest and lowest population, percentage of growth, literacy rate, sex ratio and density among the districts of the state.***

Parameter	Highest	Lowest
* Total population	Amritsar: 3,074,207	Fatehgarh Sahib:5,39,751
* Percentage of population growth	Ludhiana; 24.79	Nawanshahr: 10.43
* Literacy rate	Hoshiarpur: 81.40	Mansa: 52.50
* Sex ratio	Hoshiarpur: 935	Ludhiana: 824
* Density	Ludhiana: 804	Muktsar: 297

## Child Population (0-6 years)

The average child population in the state is 12.5 percent and most districts have similar proportion of children, except Firozpur (14.5%) which has a greater proportion of children and Jalandhar (11.2%) which has lower percentage of child population (Tables 22.1 & 22.2). The reason for higher percentage of children in Firozpur and lower percentage in Jalandhar needs to be investigated to establish the socio-economic and cultural influences on child population.

## Sex Ratio

The sex ratio for the state has fallen by 8 points from 882 to 874 over the decade, 1991-2001. Table 22.3 gives comparative sex ratio of general and child population across the districts. Among the districts in the state, the decline in sex ratio of Fatehgarh Sahib (from 871 to 851), Ludhiana (from 844 to 824), Bathinda (from 884 to 865), Patiala (from 882 to 864), Gurdaspur (from 903 to 888), Jalandhar (from 897 to 882), Firozpur (from 895 to 883) and Kapurthala (from 896 to 886)

call for an indepth study of the underlying factors. It would also be worthwhile to document the circumstances and the factors contributing to the significant improvement in sex ratio of Hoshiarpur (935) and Nawanshahr (913), which in most likelihood is the phenomenon of out-migration of male population.

### **Sex Ratio of Child Population (0-6 years)**

The steep decline in sex ratio of child population in the age group 0-6 years is alarming (Table 22.3). While the decline in the sex ratio of the entire population among certain districts has been at the most by 20 points, the decline in sex ratio of children aged 0-6 years in various districts of the state has shown a fall of upto 104 points. Invariably, all the districts have shown a decline in sex ratio of child population in the age group 0-6 years, ranging from a fall by 48 to 104 points, which averages out to a fall by 82 points in the sex ratio for the state. Essentially, it is more due to abuse of modern fetal sex determination technology followed by female foeticide and not so much due to migratory reasons. Stringent steps are required to curb the misuse of ultrasound technology and provisions of MTP for elimination of females at the fetal stage, as well as plan interventions for changing the mindset of the general population on gender issues and the girl child.

### **Nutrition**

The inadequate consumption of foodstuff at the district level is shown in the Table 22.4. Even though the state abounds in production of green leafy vegetables, yet many districts are indicated to be consuming inadequate amounts of these vegetables and thus the focus of nutrition education should be towards greater consumption of these vegetables. Districts with inadequate intake of nutrients are listed in Table 22.5. The Table shows that though, there was inadequate nutrients intake, the extent of inadequacy was mostly marginal at the district level.

Table 22.6 depicts the percentage distribution of children using Gomez, IAP and Standard Deviation classification for the nutritional indicator weight for age. According to Gomez classification, about 22 percent of the children had normal nutritional status. Almost half of the children suffered from mild (47%) and 28 percent from moderate undernutrition. Only 4 percent of the total children were severely undernourished. There were no marked differences in the prevalence of various grades of nutritional status between the sexes as well as between the age group 1-3 years and 3-5 years. At the district level, there was no major variation in the proportion of various grades of nutritional status from one district to another with a few exceptions. Rupnagar district had the lowest (3%) and Hoshiarpur district the highest (45%) percentage of normal children while in other 10 districts the percentage of normal children varied from 13 percent in Ludhiana district to 29 percent in Jalandhar district. Similarly, mild undernutrition in eleven districts varied from 41 percent in Hoshiarpur and Patiala districts to 55 percent in Ferozpur district while Rupnagar district again had the lowest prevalence of mild undernutrition (26%). Moderate undernutrition had the highest prevalence in Rupnagar district (50%) followed by Ludhiana district (43%); it varied from 14 percent (Hoshiarpur district) to 32 percent (Patiala district) in the remaining ten districts. Proportion of severely undernourished children had a range of 2 to 7 percent in the eleven districts with the exception of Rupnagar district where its prevalence was 20 percent. Nutritional problems in Rupnagar district appeared to be higher than that of other districts.

Table 22.7 shows the extent of severe undernutrition at the district level and only the districts Rupnagar needs special intervention to contain severe undernutrition. It may be seen from Table 22.8, despite the state being the food basket of the country, stunting of children and underweight are serious problems in the state, across the districts. Thus, nutrition education about sound infant and child feeding practices is called for.

## **Education**

The Student/ Teacher ratio at the Primary and Middle School level is too high in the state (Table 22.10), indicating the need to appoint more teachers, i.e., 2 to 3 times the existing strength to meet the requirements of the students enrolled. The steep decline in the ratio at High School level is largely due to the fall in enrolment of students and to some extent due to improved strength of teaching staff. Like most other states, there is a significant decline in number of students enrolled at Middle School level (52.1%) but the situation is slightly redeemed by improvement (58.7%) in enrolment figures at the High School level (Table 22.9).

## **Crimes against Children**

One fifth of the crime against children in the state were reported from Ludhiana district (20.5%) and nearly half the number of crimes against children than those reported from Ludhiana are committed in Jalandhar (9.9%) and Patiala (10.6%) districts. As can be seen from Table 22.11, Amritsar accounts for nearly 17.4 percent crimes against children. Thus, the above 5 districts out of 24 in the state account for more than half the crimes against children, and it would be useful to study the factors that make these 5 districts so hostile towards children. Since, 80 percent cases of foeticide were reported from Amristar, it would be essential to design a gender sensitization campaign in the district to protect the interests of the girl child and prevent female foeticide. Nearly 60 percent cases of kidnapping and child abduction are from the 3 districts of Amritsar (19.4%), Ludhiana (21.0%) and Patiala (19.4%) and therefore more emphasis should be laid on training parents and children on child safety, besides improving the law and order situation. More than 70 percent of the offences against children comprise of cases of kidnapping/ abduction (38.5%) and child rape (32.3%).

# Rajasthan

## State Highlights – Census, 2001

- The decadal population growth during 1991-2001 in the state has been 28.33% .
- Sex ratio for the state is 922.
- 18.37% of the total population comprises of children in the age group 0-6 years.
- The total literacy rate for the state is 61.03% but the gap between male (76.46%) and female (44.34%) is very wide.

### ***Highest and lowest population, percentage of growth, literacy rate, sex ratio and density among the districts of the state.***

Parameter	Highest	Lowest
* Total population	Jaipur: 5,252,388	Jaisalmer: 5,07,999
* Percentage of decadal growth rate	Jaisalmer:47.45	Rajsamand: 19.88
* Literacy rate	Jhunjhunu: 73.61	Banswara: 44.22
* Sex ratio	Dungarpur: 1027	Jaisalmer: 821
* Population density	Jaipur: 471	Jaisalmer: 13

## Child Population (0-6 years)

The child population comprises around 20 percent or more of the population of the state in several districts of the state, including Bharatpur, Dhaulpur, Karauli, Dausa, Churu, Jaisalmer, Barmer, Jalor, Sirohi, Dungarpur and Banswara (Tables 23.1 & 23.2). On the whole, the proportion of child population in the state is higher than that in several other states of the country. Clearly, there is a need to raise the awareness of the population regarding the small family norm and its advantages in terms of development of human resource and economic compulsions of the family in order to promote decent upbringing of children and provision of basic nutrition, education and health input at family level. It would also be essential to link the intervention to child survival and reproductive health.

## Sex Ratio

Table 23.3 ranks the districts within the state by sex ratio, also giving a comparative statement of

sex ratio of the earlier Census of 1991. Dungarpur has reported highest sex ratio of the 1027, followed by Rajsamand (1002), Pali(983), Banswara (978) and Udaipur (972). Lowest sex ratio was recorded in Jaisalmer (821) and second lowest in Dhaulpur (828). It has been observed that the tribal districts have shown higher sex ratio than the average sex ratio for the state (922). As many as half of the 32 districts have sex ratio below the national average and the state average and require concerted efforts to improve the sex ratio and gender balance in the population. There is no denying of the fact that the efforts during the past decade have slightly raised the sex ratio in all the districts but substantial inputs are required to resurrect the situation in 50 percent of the districts with sex ratio less than 900.

## **Nutrition**

Table 23.4 shows that population of none of the districts consumes food in adequate amounts and consumption of food stuffs below recommended levels in cases of individual districts can be observed for each category of food-stuffs. Table 04 (a) shows nutritional inadequacies of various districts. About 58 percent of children had both calorie and protein intake adequacy (p+c+), with almost no difference between boys and girls. Similarly, protein and calorie intake was deficient (p-c-d) in 17 percent children with no marked difference between boys and girls. Eighty three percent of the children had protein adequacy while calorie was adequate among 58 percent of children. About 71 percent of adolescents had both protein and calorie intake in adequate quantity (p+c+) and 22 percent had inadequate (p-c) intake of both. Protein, by itself was adequate among 78 percent of adolescents though calorie intake was same (71%) as above. Age-wise and sex-wise data showed that nutritional status of children deteriorated with increase in age as evident from Table 23.5. However, there were no marked sex differences. About 18 percent of boys and 19 percent girls were normal and 10 percent of both boys and girls had severe undernutrition. District-wise comparison of data discussed by the Food and Nutrition Board in India Nutrition Profile (1998), revealed that the percentage of normal children varied from 11 to 32. In most of the districts it was below 20 percent . The prevalence of mild undernutrition ranged between 33 percent in Kota district and 49 percent in Rajsamand district and moderate degree of undernutrition between 15 percent in Alwar district and 44 percent in Sawai Madhopur district. Dausa and Jhalawar districts and about 4 percent severely undernourished children as compared to 16 percent in Nagaur district. According to IAP classification, 40 percent of the total children had normal nutritional status and those with grade 1, grade 2, grade 3 and grade 4 undernutrition 26, 19,11 and 4 percent respectively.

Table 23.6 indicates that people of as many as 18 districts are energy deficient and 10 districts have iron deficient population. The combined energy and protein deficiency among children and adolescents is more than 16 and 20 percent, respectively (Table 23.7)

## **Education**

The incumbency position of teachers is much better in the state capital than other districts of the state for obvious reason (Table 23.8). Despite this the student/teacher ratio at the primary school level was as high as 389.7, indicating need for more primary schools and proportionate number of teachers (Table 23.9). The student/teacher ratio is by and large satisfactory for Middle and High

Schools except for the stray instance of student/teacher ratio of 155 for middle schools of Chittaurgarh. There is a visible need to increase the staff strength of teachers at Primary School to properly attend to the educational needs of children enrolled at the Primary School level in all the districts of the state. Thus, the governmental effort and the inputs of NGOs and international agencies have to focus accordingly.

### **Coverage of Children under NCLPs**

Out of the sanctioned 140 schools under NCLPs, only 55.7 percent are operational, catering to 3900 children from Udaipur and Jaipur. It may be noted from Table 23.10 that none of the 20 schools sanctioned for each of the districts Ajmer, Tonk and Jodhpur has been made functional, resulting in no educational facilities for 3000 child labourers of these three districts. Thus, special efforts should be made to make the NCLP schools operational in the 3 districts where these have not been made operational after sanction as these would cater to more than 42 percent of child labour identified for educational and other inputs.

### **Crimes against Children**

More than one-fifth offences against children in 33 districts of Rajasthan have been reported from Banswara district alone (Table 23.11). Further, 45 percent of the crimes against children in Banswara comprise of child rapes and another 33 percent cases relate to kidnapping and abduction. Thus Banswara should be a focal district for interventions against crimes perpetrated on children. Special social campaigns should be designed for Banswara, which accounts for half the number of rapes in the state. Over 10 percent of the crimes against children have been reported from Kota district, mainly comprising of kidnapping and abduction (10) and exposure and abandonment (8). Third district with nearly 10 percent crimes against children (20) in the state is Dholpur and half (10) of the reported offences are kidnapping and abduction of children. Hanumangarh is the next district which had reported 7.4 percent crimes in the state against children, including child rape, child murders and kidnapping and abduction of the children. Even though literature and research journals discuss infanticide and foeticide of females, officially reported data shows only less than 1 percent cases of infanticide and only 2.9 percent cases of foeticide. Infanticide was reported from Bikaner and Jodhpur cases of foeticide were from Bikaner, Bundi, Jhunjhunu and Karauli.

Child marriages constituted only 7.4 percent of the offences against children. Such marriages have been officially been reported from Chittorgarh, Dausa and Rajsamand.

# Sikkim

## State Highlights – Census, 2001

- Children in the age group 0-6 years comprise 14.28 percent of the population.
- Only 9.72 percent of the urban population is in the age group 0-6 years.
- The decadal growth of urban population (62.15%) has been faster than that of the rural population (30.05%).
- The literacy rate for the entire population aged 7 years and above is 69.68%.

## ***Highest and lowest population, percentage growth, literacy rate, sex ratio and density among the districts of the state.***

Parameter	Highest	Lowest
* Total population	East District: 2,44,790	North District: 41,023
* Total rural population	East District: 1,91,803	North District: 39,775
* Total urban population	East District: 52,987	North District: 1248
* Percentage of population growth	East District: 37.17	West District: 25.48
* Literacy rate	North District: 69.11	West District: 59.31
* Sex ratio	West District: 930	North District: 752

## Child Population (0-6 years)

About 14.28 percent of the population comprises of children in the age group 0-6 years (Table 24.1). Gender-wise disaggregation of this data shows that the percentage of boys and girls aged 0-6 years works out to 13.48 and 15.19 percent, respectively. The greatest proportion of children under 7 years within the district population has been reported in West District (16.06%), closely followed by South District (15.83%) and the lowest proportion of children in the age group 0-6 years has been found in East District (12.39%). It is noteworthy that the majority population in the age group 0-6 years resides in the rural areas. Thus, while planning programmes for children this information has to be taken into consideration.

## Sex Ratio

Table 24.2 presents the sex ratio of the general population and the child population below 6 years. Sex ratio of Sikkim (875) has been much below the national average of 933. The ratio is much

better in rural areas (881) of the state as compared to the urban areas (828). While the sex ratio in West (930) and South (927) districts is closer to the national average, the ratio is abysmally low in the North District (752) followed by East District (844). The inter-district variation in the sex ratio and extremely low sex ratio in the North District (752) requires proper assessment and intervention to correct the gender imbalance.

### **Sex Ratio of Child Population**

The sex ratio in the age group 0-6 years (986) is much higher than that of the entire population (Table 24.2). It is heartening to observe that the child sex ratio is better than the sex ratio for the general population in all the 4 districts of the state. It would be interesting to study the factors responsible for child sex ratio in South Sikkim being above 1000.

### **Nutrition**

The districts with inadequate food consumption is listed in Table 24.3. Specific nutrition education campaigns have to be organised district-wise, catering to the needs of the district in question. In districts of north and east Sikkim, the importance of pulses in diet as a protein source has to be emphasised, as the consumption of milk is also inadequate in diet. Similarly, significance of green leafy vegetables in diet has to be propagated, in order to improve the vitamin A intake in the milk deficient diets and to enhance the iron status of the population. The districts with inadequate intake of nutrients are shown in Table 24.4 and it is clear that iron deficiency is rampant in the state across all the districts. The nutrition education should cover prevention and control of iron deficiency anemia as an essential component and distribution and consumption of iron and folic acid tablets has to be ensured in each district. The protein energy adequacy status in the State is shown in Table 24.5. The energy-protein adequacy improved with age, as the children moved towards adolescence. Thus, the main emphasis of educating mothers should be the infant and child feeding practices and best practices from the local culture be promoted and the faulty ones be modified.

The prevalence of severe undernutrition in the districts is given in Table 24.6. More attention is to be paid towards severe undernutrition in the eastern, southern and western parts of the state. The percentage distribution of children according to Standard Deviation classification for underweight, stunting and wasting at district level is shown in Table 24.7. The major problems relating to undernutrition of children are stunting due to chronic malnutrition and underweight due to recent malnutrition.

Table 24.8 shows the nutritional status of school age children and adolescents according to Gomez classification. The prevalence pattern of nutritional status in 5-12 years and 13-18 years of the surveyed population was different. Less than one-fourth of the children (22%) in the age group of 5-12 years and more than one third (35%) in the age group of 13-18 years had normal nutritional status. Mild, moderate and severe undernutrition were prevalent among 36, 35 and 7 percent of the children respectively, in the age group of 5-12 years and among 31, 25 and 9 percent of adolescents respectively, in the age group of 13-18 years. Male-female differences in the various grades of undernutrition were not observed in the age group of 5-12 years, while it was markedly different in the age group of 13-18 years. Adolescent girls exhibited a better nutritional status than that of the boys.

## **Education**

There is a considerable fall in the enrolment of students at the Middle (by 68%) and High School (83.3%) levels and a concerted effort is required to improve the enrolment of children in each district of the state (Table 24.9). Also, the number of schools and number of teachers recruited at the Middle and High School level has to be stepped-up to meet the infrastructural and manpower needs of school education (Table 24.10).

## **Crimes against Children**

Four cases of child rape were reported from East Sikkim while one child murder was reported from the 2 districts of East and South Sikkim (Table 24.11). On the whole, the state is peaceful with respect to offences against children. An intervention campaign designed for East Sikkim would enable curtailing offences against the girl child.

# Tamil Nadu

## State Highlights- Census, 2001

- Tamil Nadu constitutes 6.05% of the country's population and ranks 6<sup>th</sup> among states and UTs.
- The growth rate of population in the state has declined from 15.39% during 1981-91 to 11.91% during 1991-2001.
- Nine districts showing higher decennial population growth rate in comparison to the corresponding state average (11.19%), include Thiruvallur (22.35%), Coimbatore (20.40%), Kancheepuram (18.84%), Dharmapuri (16.66%), Salem (16.28%), Vellore (15.09%), Namakkal (13.08%), Tirunelveli (11.97%), and Virudhunagar (11.92%).
- The three districts showing decennial growth rates lower than the state average include Sivaganga (4.32%), theni(4.33%) and Kanniyakumari(4.34%).

## ***Highest and lowest population, percentage of growth, literacy and sex ratio among the districts of the state***

Parameter	Highest	Lowest
* Total population	Chennai: 4,343,645	Peramballur: 493,646
* Literacy rate	Kanniyakumari: 88.11	Dharmapuri: 59.23
* Sex ratio	Thoothukuddi: 10.49	Salem : 929
* Percentage decadal growth rate	Tiruvallur: 22.35	Sivaganga: 4.32

## Child Population (0-6 years)

The average proportion of child population for the state is barely 10.9 percent (Table 25.1 & 25.2). The prime reason for the children comprising just 8.6 percent of the total population of Chennai is the influx of adult population for labour, leaving behind their families. The reason behind comparatively larger proportion of children in Sivaganga (15.0%) and Thoothukkudi (19.1%) need to be studied and factors responsible for the same may require strategic intervention.

## **Sex Ratio**

As evident from Table 25.3, sex ratio in the state has improved from 974 in 1991 to 986 in 2001. Half the districts (15) in the state have reported sex ratio of more than 1000, showing an encouraging trend as compared to 5 districts having sex ratio of more than 1000. The improvement in sex ratio in the Nilgiris 2001 needs to be studied, besides evaluating the interventions employed by the state to register the remarkable achievement of raising sex ratio in 10 districts during Census, 2001 in addition to 5 districts during Census, 1991.

## **Education**

The absolute figures of district-wise infrastructure, enrolment and manpower for education are in Table 25.4. This data when deduced to ratio (Table 25.5) reflects the position of schools and availability of teachers for education at various levels. While only Dharmapuri district shows lack of teachers in primary school which can be sorted out with paying some attention to the localized problems but on the whole the availability of teachers in the state at the districts level was much better than many other states. The schools at Primary and Middle School level have an undesirably high proportion of children per teacher and visibly there is a need to recruit more number of teachers to bring the student/ teacher ratio to a reasonable level. The decline in student/teacher ratio at the High School level could be due to fall in enrolment of children after Middle School level (Table 25.5). Thus, there is a need to improve enrolment in schools at High School level in each district of the state.

## **Coverage of Children under NCLPs**

Only 353 schools for child labour are operational of the sanctioned 425 schools under the NCLPs (Table 25.6). All the 24 schools sanctioned to NGOs are functioning and educate 1850 child labourers. Presently the 353 schools under NCLP cover 17,190 children in the target areas. On the additional 72 schools being operational as many as 4710 more child labourers would receive education and the entire target population involved in child labour will be covered. As many as 50 out of the 72 sanctioned school yet to be operational belong to Triunelveli district and would educate 2500 children involved in labour in that district.

## **Crimes against Children**

Murder is the most commonly reported (33.3%) crime against children and more than one third of murders of children are infanticides (35.6%). In the overall crime situation for child population, infanticides constitute 11.9% of the reported offences (Table 25.7). Both rape and kidnapping (21.5%) / abduction of children (21.5%) jointly occupy the position of second most heinous crime against children.

Infanticides were reported from Madurai (rural), Namakkal, Peramabadur, Ramnathapuram, Sivagangai and Virudhunagar and therefore campaigns against female infanticide should focus on these districts. Child rapes occurred in Dindigul, Chennai, Coimbatore and Virudhunagar and call for social intervention to change the mindset of people and improve security measures for the girl child to prevent rapes in these districts. Most cases of kidnapping and abduction of children took place in Virudhunagar (12) and Thiruvanamalai (8) and all efforts to bring down this offence against children should target purposively on these 2 districts.

# Tripura

## State Highlights – Census, 2001

- The decadal population growth for the state was 15.74 percent during 1991-2001.
- Sex ratio of Tripura is 950, which is above the National average of sex ratio.
- Literacy rate in the state is 73.66 percent and the female literacy rate is 65.41 percent and the figures have been consistently improving over the decades.
- Child population in the age group 0-6 years is 13.38 percent.

## *Highest and lowest population, percentage of growth, literacy rate, sex ratio and density among the districts of the state*

Parameter	Highest	Lowest
* Total population	West Tripura: 1,530,531	Dhalai: 3,07,417
* Total rural population	West Tripura: 1,123,030	Dhalai: 2,88,546
* Total urban population	West Tripura: 4,07,501	Dhalai: 18,871
* Percentage of population growth	South Tripura: 40.30	North Tripura: 30.86
* Literacy rate	West Tripura: 77.82	Dhalai: 61.56
* Sex ratio	West Tripura: 944	Dhalai: 931

## Child Population (0-6 years)

Children in the age group 0-6 years comprise 13.88 percent of the total population (Table 26.1). While 14.20 percent of rural population is in the age group 0-6 years, only 9.39 percent of urban population falls in this age group, as per Census, 2001. Percentage of child population in the age group of 0-6 years is the highest in Dhalai among the districts of Tripura, when considered in terms of overall district population (15.26%) as well as rural (15.53%) and urban (11.06%) population. On the other hand, West Tripura is the district with lowest child population (12.34%) in the district-wise ranking, as well as is the district with lowest child population in its rural (13.44%) and urban (9.05%) areas.

## Sex Ratio

Table 26.2 shows that Tripura has the sex ratio of 950 for its total population and the ratio declines slightly for its rural areas to 948 and is as high as 962 for its urban areas. West Tripura has reported the highest sex ratio of 953 in the state, while Dhalai has the lowest sex ratio of 940. In

case of rural areas, South Tripura showed the highest sex ratio (952) and Dhalai exhibited the lowest sex ratio (943). In urban areas, West Tripura is having highest sex ratio (971) while Dhalai is having lowest sex ratio (892).

### **Sex Ratio of Child Population (0-6 years)**

The sex ratio for population in the age group 0-6 years in state is 975 (Table 26.2). In rural areas there are 978 girl children and in urban areas there exist only 948 girl children against every 1000 boy children in the population aged 0-6 years in Tripura. While West Tripura had registered the highest sex ratio (983), South Tripura has the lowest sex ratio (962) in the child population group in the age group 0-6 years. Similar district wise trend is observed in rural children aged 6 years and below, as the ratio is 993 for West Tripura and 964 for South Tripura. Among urban areas of Tripura, Dhalai has the highest sex ratio of 980 and South Tripura ranks the lowest with sex ratio of 919.

### **Nutrition**

A district-wise comparison of food consumption showed that North Tripura district had highest level of consumption of cereals, pulses and vegetables and lowest level of consumption of milk and its products and flesh food as compared to those in other two districts. The districts with inadequate intake of foodstuff is listed in Table 26.3. The nutritional intake pattern in the districts presented in Table 26.4 indicates major micronutrient inadequacies in the diets. Both, iron and vitamin A intake is reported to be inadequate, calling for supplementation of diets and improving feeding patterns to prevent and control micronutrient malnutrition. The silent hunger is all pervasive and needs to be satiated with an integrated nutrition package.

Table 26.5 shows that nearly one-third of the children in the state consume diets that are deficient to meet their energy and protein requirements. The situation improves as children develop into adolescents. This indicates that the need is for proper education of mothers in infant and child feeding. The district-wise prevalence of underweight, stunting and wasting is shown in Table 26.6. At the district level, North Tripura district showed slightly better nutritional status of the children as compared to the other two districts.

### **Education**

It is encouraging to observe that the north-eastern state has 4400 Pre-primary Schools and 2095 Primary Schools (Table 26.7) but the number of schools at the Middle and High School level are as less as 432 and 636, respectively. Only about 36 percent of the children enrolled at Primary School level are enrolled at Middle School level. The number of students' further fall at High School level, resulting in only 22.6 percent of children enrolled at elementary school level continuing at the High School level. Thus, the educational infrastructure and manpower is inadequate at the three levels as reflected by high student/ teacher ratio at Primary School level and less number of schools at Middle and High School level (Table 26.8). Much lesser number of students are enrolled at the Middle and High School level in all the districts, indicating the need to promote education through a consistent effort involving reaching out to the community and motivating them to continue education of children beyond the elementary level and simultaneously removing impediments in child education.

## **Crimes against Children**

It is encouraging to observe (Table 26.9) that reportedly there have been no cases of offences against children, despite the environment of violence and insurgency in the state over a long period in the past.

# Uttar Pradesh

## State Highlights – Census, 2001

- The decadal growth rate had been nearly static during the period 1991-2001.
- The sex ratio for the whole state during Census 2001 remained below 900 mark, at 898.
- The female literacy in the state still as low as 42.98 percent.
- Nearly 18.4 percent of the population comprises of children

## *Highest and lowest population percentage of growth, literacy and sex ratio among the districts of the state*

Parameter	Highest	Lowest
* Total Population	Allahabad:4,941,510	Baghpat:1,164,388
* Literacy rate	Ghaziabad: 70.89	Shravasti: 34.71
* Sex ratio	Azamgarh: 1026	Mathura & Badaun:841

## Child Population (0-6 years)

Most districts in the state have child population to the extent of 18 to 20 percent of the whole population (Table 27.1). Only Lucknow (14.2%) and Jhansi (15.4%) have child population lesser than most districts in the state (Table 27.2) and it would be necessary to find out whether this is due to lesser number of children in the households or due to a greater influx of adult migrant population. In view of a high proportion of children in most districts of the state, it would be imperative to have a state specific strategy to improve child survival and limit family size, emphasizing on better human resource development and better quality of life.

## Sex Ratio

Sex ratio in most districts of the state is below 900 even in Census 2001 (Table 27.3). Only 3 districts have sex ratio above 1000, namely - Azamgarh (1026), Jaunpur (1021) and Deoria (1003). It would be interesting to investigate the factors which make these 3 districts stand out with a positive population gender balance in favour of females when most districts have sex ratio below the 900 mark. The state, as a whole needs intensive gender sensitisation campaigns to improve the gender balance through a systematic intervention strategic plan.

## **Education**

Student/ Teacher ratio is high in Primary and Middle Schools of most of the districts (Table 27.5) probably due to inadequate number of teachers for the number of students enrolled. The number of students enrolled at the Primary School level declined to just 34.9 percent at the Middle School level and further to 24.8 percent at High School level (Table 27.4). There is an urgent need to take steps to enhance school enrolment at the Middle and High School levels to improve the human resource of the state. It would be essential to impress upon the community the benefits of completing schooling by all children and utilising the infrastructure for education for better awareness and living conditions.

### **Coverage of Children under NCLPs**

As many as 11 districts in the state have NCLPs with a sanction of 370 schools for 22,500 child labourers (Table 27.6). However, the implementation requires an impetus to fully operationalise the sanctioned schools. Only 170 of the 370 schools are operational, covering 11,925 of the 22,500 children proposed.

### **Crimes against Children**

Table 26.7 shows kidnapping and abduction of children was the most common (29.5%) offence against children, followed by child murder (23.2%) and child rape (22.8%). Agra accounted for 8% of the crimes against children and Bareilly was responsible for another 5.9%. Around 20.7% of the kidnapping and abduction cases in the state were reported from Agra. Nearly 9.1% cases of child rapes were from Bareilly. Gorakhpur accounted for 7.0% cases of child murders. Cases of infanticide were reported from Allahabad, Ambedkar Nagar, Azamgarh, Baghpat, Faizabad, Shahjahanpur and Sultanpur and special intervention needs to be designed for these districts to prevent infanticide. Both Agra and Bareilly require tailor-made campaigns to curb crimes against children.

**Table 27.1 : Population in the Age Group 0-6, Number of Literates and Literacy Rate by Sex for State and Districts, 2001**

Sl. no.	State/ District	Total Population			Population in age group 0-6						Number of Literates						Literacy rate

# Uttaranchal

## State Highlights – Census, 2001

- The growth rate of population reduced by 5 percent during the decade 1991-2001.
- Female literacy was around 60.26 percent, as per Census, 2001.
- Total literacy rate in the state rose to 72.28 percent during Census, 2001.
- Sex ratio improved by 28 points in the state over the decade 1991-2001.
- While the sex ratio for general population was 964, it was only 905 for the child population in the age group 0-6 years.

## *Highest and lowest population percentage of growth, literacy and sex ratio among the districts of the state*

Parameter	Highest	Lowest
* Total Population	Haridwar: 1,447,187	Champawat: 224,542
* Sex ratio	Almora: 1,147	Haridwar: 868
* Literacy rate	Dehradun: 881, 476	Champawat:131,627

## Child Population (0-6 years)

Children upto 6 years constitute around 15.5 percent population of the state (Table 28.1). However, the three districts of Haridwar, Champawat and Udham Singh Nagar have child population of more than 17 percent (Table 28.2), indicating a need to devise strategies to empower communities in general and women in particular to plan small families. Dehradun may be a suspect as an area where investigation may be required to confirm whether the smaller proportion of child population (12.7%) is due to violation of the provisions of the PNMT Act and selective abortions or some other preventable cause.

## Sex Ratio

It is encouraging to observe from Table 28.3 that 5 of the 13 districts in the state have sex ratio of above, 1,000 but most of these are hilly tribal districts. In the plains, the story is different. Both Haridwar (868) and Dehradun (893) have sex ratio below 900, which could be a situation arising

out of female foeticide and infanticide and would require intervention to correct the gender imbalance.

## **Education**

The high student/teacher ratio at the Primary (35.5) and Middle (34.0) School level indicate that the manpower at these two levels to teach children is inadequate and recruitment of more teachers is desirable. Further, the gross enrolment figures related to children in Table 28.4 show that the enrolment of children falls to 46.7 percent and 36.3 percent at the Middle and High School levels, indicating the need to improve enrolment at higher levels of school education, after Primary School level and the focus of child education at the very first place should be the stepping up of enrolment of children in schools.

## **Crimes against Children**

Haridwar appears to be the most notorious district, as far as crimes against children are concerned, as 92.6 percent of offences against children have been reported from this district (Table 28.5).

One third of the cases of crimes against children relate to child rapes and another one third relates to procurement of minor girls. Nearly 26 percent of crimes against children comprise of child murders. Special campaign against crimes perpetrated on children needs to be designed for Haridwar.

## State Highlights – Census, 2001

- The decadal growth rate was 6.9 percent for the decade 1991-2001.
- As many as 69.22 percent of the population was literate as per Census 2001.
- The female literacy in the state was as high as 60.22 percent.
- Sex ratio for the state improved by 17 points, from 917 to 934 during Census 2001

## *Highest and lowest population percentage of growth, literacy and sex ratio among the districts of the state*

Parameter	Highest	Lowest
* Total Population	North 24 Parganas:8,930,295	Dakshin Dinajpur:1,502,647
* Literacy rate	Kolkata: 81.31	Uttar Dinajpur: 48.63
* Sex ratio	Medinipur: 955	Kolkata: 828

## Child Population (0-6 years)

The average proportion of children in the state is around 13.9 percent (Table 29.1). However, a few districts like North Dinajpur (20.7%), Malda (19.2%) and Murshidabad (17.5%) have a much higher proportion of children (Table 29.2) and probably these are the districts where campaigns to limit family size and providing better future to children should be focussed. Kolkata may have a higher proportion of adult migrant population for employment in the metropolis, leading to lowest proportion of child population (8%). It would be essential to investigate whether in the districts North 24 Parganas, Hooghli and Haora the child population is less than 12 percent due to low rate of child survival and the related factors.

## Sex Ratio

Though the average sex ratio for the state has improved by 17 points during the decade, still there are areas of concern related to gender balance (Table 29.3). Even if the sex ratio of Kolkata has improved by 29 points, from 799 in Census, 1991 to 828 in Census, 2001, still it is more than 100 points below the state average of 934. It would be worthwhile to attempt a rapid appraisal of the underlying factors responsible for low sex ratio in Kolkata to workout a feasible strategy to restore gender-balance to the extent possible.

## **Education**

The student/ teacher ratio is quite high at the Primary and Middle School levels and falls sharply at the High School level (Table 29.5). This indicates that the teaching manpower needs to be increased at the Primary and Middle School level in proportion to children enrolment of children at the High School level needs to be improved. The enrolment of children declined by 68.4 percent and 80.6 percent, respectively at the Middle and High School levels, when compared with enrolment at the Primary level (Table 29.4). Thus, more emphasis is required in enhancing enrolment at the two higher levels of school education in the state.

### **Coverage of Children under NCLPs**

As many as 299 schools have been sanctioned under NCLPs scheme to cover 15,000 child labourers (Table 29.6). However, only 77.4 percent of the sanctioned strength is being covered through 234 schools. The 40 schools sanctioned for Murshidabad are yet to be functional after being recently sanctioned. Efforts need to be stepped up to operationalise these schools to enable child labour to gain access to basic education. Only 63 percent of children involved in labour are enrolled in schools under NCLP and therefore, more efforts are required to cover the entire targeted child labour by making the remaining 21 schools operational.

### **Crimes against Children**

Kolkata reported maximum proportion (82.3%) of cases of offences against children (Table 29.7). Both Kolkata and Malda jointly contribute 94.9% of the crimes against children. Nearly 46.5 percent of offences against children in Kolkata are cases of kidnapping and abduction and another 11 percent cases pertain to rape. All cases of crimes against children in Malda were of kidnapping and abduction. Child rapes were reported only from Kolkata.

# Andaman and Nicobar Islands

## UT Highlights – Census, 2001

- Decadal growth rate declined by 21.76.
- Decadal growth rate of Nicobar Islands in Census, 2001 was around one fourth of the rate in Census 1991.
- Sex ratio of the Islands improved by 28 points.
- Female literacy was 42.1 percent.

## Child Population (0-6 years)

Around 12.5 percent of the population of the Islands comprises of children (Table 30.1). The proportion of children is more or less similar in both the Andamans and the Nicobars.

## Sex Ratio

Though the sex ratio in the Islands has improved (from 818 to 846) by 28 points over the decade, 1991-2001 (Table 30.2), yet it is far below the ideal ratio. It would be essential to study the socio-cultural reasons responsible for persisting low sex ratio, in order to take effective steps to raise the sex ratio significantly by the next census.

## Education

The manpower for education of children appears to be adequate in the Islands (Tables 30.3 & 30.4). The student/ teacher ratio reflects that a few more primary schools and teachers would ease the situation. Further, the extremely low student/ teacher ratio at the High School level indicates that very few students enroll at that level. The enrolment figures reveal that the enrolment of children falls to 54 percent and 41.8 percent at the Middle and High School levels, respectively and therefore retention of children in school after Primary School level is the challenge to be addressed in the Islands.

## Crimes against Children

As can be seen from the reported crime situation in Table 30.5, no crime was reported to have been committed against children in the Islands.

# Chandigarh

## UT Highlights – Census, 2001

- The decadal population growth of the UT was as high as 40.33 percent.
- The sex ratio of the population was reported to be 773, which is much lower than the national average.
- The literacy rate for the entire population of the UT was found to be 81.76 for the entire population but female literacy was only 76.65 percent.
- Only 12.13 percent of the population in the UT comprise of children aged 0-6 years.

### Figures at a Glance

#### Decadal Population Growth 1991-2001

Total	258899	25932	232967
Percent	+40.33	+39.18	+40.46
<b>Population Density</b>	7903	2658	10194
(No. of persons/sq. k.m.)			
<b>Sex Ratio</b>	773	621	792
(Females /1000 Males)			

#### Population in age-group 0-6

Persons	109293	14007	95286
Male	59238	7562	51676
Female	50055	6445	43610
<b>Percentage of Total Population</b>			
Persons	12.13	15.21	11.78
Male	11.66	13.20	11.45
Female	12.75	18.27	12.20

## **Child Population**

Only 12.1 percent of the population of Chandigarh comprise of children (Table 31.1). Of the child population 54.2 percent are boys and 45.8 percent are girls. While rural areas of Chandigarh have children constituting 15.2 percent of the rural population, the urban child population is around 11.8 percent, pointing towards the fact that lower proportion of urban child population may be due to migration of adults for employment.

## **Sex Ratio**

The overall ratio of Chandigarh is alarmingly low (773) and is still worse in rural areas (621), when the ratio is compared with the national figures related to sex ratio (Table 31.2). The differences of 152 points in urban and rural sex ratio needs investigation into the reasons for such a difference as well as the grounds for an extremely low sex ratio of 621 in rural Chandigarh to improve gender balance in population.

## **Sex Ratio of Child Population (0-6 years)**

Though child sex ratio (845) is better than the adult sex ratio (773) for Chandigarh, yet it is much below the ideal ratio and doesn't cross the 900 mark (Table 31.2). A lot of effort is required through systematic planning and intervention to restore the gender balance. Unlike sex ratio for whole population, the child sex ratio for rural and urban population doesn't show much difference.

## **Education**

Tables 31.3 and 31.4 when studied together, reflect that the infrastructure and manpower is grossly inadequate at primary level, resulting in a very high student/ teacher ratio (203.7) since there are only 29 primary schools enrolling 58,050 children. Further, there is a steep fall in enrolment of children at the middle school level but the student/ teacher ratio still remains high (136) due to inadequate manpower and infrastructure.

## **Crimes against Children**

Nearly 45 percent of the offences against children in Chandigarh comprise of cases related to kidnapping and abduction, followed by lesser proportion of cases of exposure and abandonment (16.3%) and rape (12.2%). A few cases of child murders (6.1%) have also been reported (Table 31.5). Thus, the major problem in Chandigarh is of kidnapping and abduction of children and parents, guardians and teachers have to be educated accordingly to reduce the incidence of this offence.

# Dadra & Nagar Haveli

## UT Highlights – Census, 2001

- Children in the age group 0-6 years constitute 17.77 percent of the population.
- The sex ratio of the UT has been reported to be as low as 811, which is much below the National figure of 933.
- The decadal growth has been as high as 59.20 percent.
- Barely 60.03 percent of the population is literate.

## Child Population (0-6 years)

About 17.8 percent of the population of the UT comprises of children below 7 years of age (Table 32.1).

## Sex Ratio

Except for 1971, the sex ratio of the UT has always been below the 1000 mark. The steep decline in the sex ratio from 952 in 1991 to 811 in 2001 (Table 32.2) requires an investigation for improving the ratio.

## Education

As evident from Tables 32.3 and 32.4, there are an inadequate number of schools at the Primary School level, in proportion to the number of students enrolled at that level, leading to a student/teacher ratio. Similarly, inadequacy of the number of teachers at the primary school level indicates the need to enroll more teachers at that level. The enrolment of students fell by 65.6 percent from primary to middle school level and further declined to 17.7 percent by the time children reached High School level. Thus, there is urgency for recruiting more teachers in Primary Schools. Early childhood stimulation may be given special attention as the UT doesn't have any pre-primary schools.

## Crimes against Children

As per Table 32.5, no crimes had been reported to be committed against children during 2002.

**Table 32.1 : Population, Population in the Age Group 0-6, Number of Literate and Literacy Rate by Residence and Sex, State and Union Territory, 2001**

Sl. No.	UT/ District	Total Population #		Population in age group 0-6 years			Number of Literates*			Literacy rate**

# Daman & Diu

## State Highlights - Census, 2001

- There had been a phenomenal growth of population (55.59%) of the during decade 1991-2001.
- The UT ranked 34th in population size among states and UTs of the country.
- Daman & Diu ranked 9th literacy in the all-India ranking of states and UTs.
- The UT ranked lowest in sex ratio among the states/UTs of India.

## *Highest and lowest population, percentage growth, literacy and sex ratio among the districts of the UT.*

Parameter	Highest	Lowest
• Population	Daman: 1,13,949	Diu: 44,110
• Percent population growth	Daman: 83.49	Diu: 11.71
• Literacy	Daman: 83.60	Diu: 74.14
• Sex ratio	Diu: 1117	Daman: 591
• Density	Daman: 1583	Diu: 1103

## Child Population (0-6 years)

Around 13 percentage of the population is in the age group 0-6 years. As per Table 33.1, the child population is greater in Daman (20012) than in Diu (7416). Nearly 48 percent of the child population aged 0-6 years comprises of girl children.

## Sex Ratio

The sex ratio has been continuously falling in the UT over the decades since independence. The decline in the sex ratio in Daman & Diu has been drastic during 1991-2001, as evident from the data of Census, 2001. While the sex ratio was 969 during Census, 1991, the ratio has steeply fallen to 709 during the Census, 2001 (Table 33.2). The decline in rural sex ratio, (from 922 to 585 ) is noteworthy. In all probability the negatively skewed sex ratio is due to out-migration, and needs to be confirmed. Though there is a fall in sex ratio in urban areas, it is comparatively less steep

than that observed in the rural areas. For any policy formation and modification regarding women and children, it would be essential to deeply study the underlying factors affecting the dynamics of the gender composition of the population and take appropriate measures.

### **Sex Ratio of Child Population (0-6 years)**

The highest sex ratio for the entire population, as well as the child population upto 6 years has been recorded in Diu. The urban areas (1173) of Diu have a higher sex ratio than its rural areas (1065) for the total population (Table 33.2). The same trend is observed for the population aged 0-6 years, as observed from the data during Census, 2001 for rural (945) and urban (982) areas of Diu. It is significant to observe that the overall sex ratio of child population in the age group 0-6 years (959) is much lower than the sex ratio for the entire population (1117). While not much difference has been observed in the sex ratio of child population aged 0-6 years of in rural and urban areas of Daman, it is much better than the sex ratio for the rural and urban population of Daman.

### **Education**

The Student/Teacher ratio was better in Daman than in Diu at all levels, and more pronouncedly at the Pre-primary and Primary School level (Table 33.4). The main reason for such ratio at the Primary School level was not the enrolment of greater number of students but recruitment of half the number of teachers in proportion (Table 33.3).

### **Crimes against Children**

As per Table 33.5, no crimes were reported to have been committed against children.

**Table 33.1 : Population, Percentage Decadal Growth, Percentage of Child Population in the Age-Group 0-6 Years by Residence and Percentage of Urban Population, Union Territory and District 2001**

# Lakshadweep

## UT Highlights – Census, 2001

- Lakshadweep has barely 0.01 percent of the country's population but ranks 4<sup>th</sup> in population density, among the states/ UTs of the country.
- The islands rank 14<sup>th</sup> in sex ratio ranking of states/ UTs with a sex ratio of 947.
- Lakshadweep ranks 3<sup>rd</sup> in literacy with 87.52 percent of its population literate.
- 81.56 percent women/ girls in the islands are literate.
- Percentage decadal population growth in Lakshadweep was recorded as 17.19 percent.
- Sex ratio of children aged 0-6 years has significantly risen from 941 in 1991 to 974 in 2001.

## Child Population (0-6 years)

The total population of the Islands is presented in Table 34.1. The child population in the age group 0-6 years constitutes nearly 14.62 percent of the total population of the island (Table 34.2), which is slightly less than the national average of 15.42 percent for the whole country. Among the UTs, it is the second in ranking for proportion of child population aged 0-6 years, after Dadra and Nagar Haveli with 17.77 of population in the age group 0-6 years. There has been significant fall in the proportion of child population in the age group 0-6 years, as evident from the comparative study of the Census data for 1991 and 2001. This decline has been greater in urban areas (by 4.89%) than in rural areas (by 3.06%) of the UT. The Census, 2001 has recorded a negative growth of child population in the age group 0-6 years (-6.38%), with a more pronounced negative trend in urban areas (-33.15%). This adverse growth of urban child population in the age group 0-6 years is off-set to some extent by the growth of 25.24 percent in rural population in the same age group.

## Sex Ratio

A higher sex ratio has been reported in rural areas than the urban areas of the UT (Table 34.3). Taking all the islands together, Minicoy ranks first in sex ratio in Lakshadweep with 1057 females

per 1000 males, which is reportedly due to the out-migration of male workers from Minicoy for seafaring profession on Indian and foreign ships. The sex ratio has declined in three of the islands in the UT, requiring an inquest into the underlying factors.

### **Sex Ratio of Child Population (0-6 years)**

As evident from Table 34.4, the sex ratio of children in the age group 0-6 years (974) is slightly favourable to females compared to the ratio in the case of the entire population of the islands in the UT (947). For the same population group, the ratio in rural areas (1010) is more favourable as compared to the sex ratio for total rural population (957). On the other hand, urban areas have reported a lower sex ratio for girl children aged 0-6 years (920) than the ratio for the urban female child population (936).

### **Education**

Tables 34.5 and 34.6 indicate that there is a paucity of teachers at the Middle School level, when the figures for enrolment are compared with teaching strength at each level. There is also the visible need to enhance enrolment of children at Middle and High School level, as enrolment fell by 40 and 61 percent, respectively, at both the levels.

### **Crimes against Children**

No crime had been reported against children in the Islands (Table 34.7).

# Pondicherry

## UT Highlights – Census, 2001

- The UT registered a decadal population growth of 20.56 percent during 1991-2001.
- The sex ratio was nearly even as for every 1000 males, there were 1001 females.
- 11.60 percent of the population of the UT comprised of children in the age group 0-6 years.
- Literacy rate for Pondicherry was recorded as high as 81.49 percent.

### *Highest and lowest population, percentage of growth, literacy rate, sex ratio and density among the districts of the state*

Parameter	Highest	Lowest
* Total population	Pondicherry: 1,26,666	Mahe: 3376
* Percentage of population growth	Yanam: 54.52	Mahe: 10.09
* Literacy rate	Mahe: 94.10	Pondicherry: -73.35
* Sex ratio	Mahe: 1148	Yanam: 975
* Density	Mahe: 4091	Karaikal: 1060

## Child Population (0-6 years)

The total population of the UT is given in Table 35.1. The district of Pondicherry has the greatest proportion of children aged 0-6 years (84,004 out of 1,13,010) among the 4 districts of the UT. As can be seen from Table 35.2, nearly 11.60 percent of the total population of the UT comprise of children in the age group 0-6 years, with nearly equal proportion of girls (5.68%) and boys (5.93%).

## Sex Ratio

The highest sex ratio of 1148 has been recorded in Mahe, closely followed by the ratio of 1023 in Karaikal (Table 35.3). The lowest sex ratio of 975 has been observed in Yanam. As per the decadal variation in proportion of male and female population, there has been a marginal shift in favour of males. During 1991, 49.98 percent of population was male and during 2001 the male population comprised 50.52 percent of the total population.

## Education

The Student/ Teacher ratio at the Primary and Middle School level is too high (Table 35.5) and indicates that the number of teachers recruited at these 2 levels are grossly inadequate in

comparison to the number of children enrolled. Also, the problem of fall in enrolment figures at higher educational levels is evident even in Pondicherry (Table 35.4). The enrolment of students dropped by 34.6 and 50.3 percent at Middle and High School levels, respectively, after the Primary School.

### **Crimes against Children**

Table-35.6 indicates that child rape (23.5%) and kidnapping/ child abduction (23.5%) are the most commonly reported crimes, followed by child murder (11.8%).
